

SEATTLE CITY LIGHT DISTRIBUTION AUTOMATION

Ryan Pham

Project manager

01/27/2016

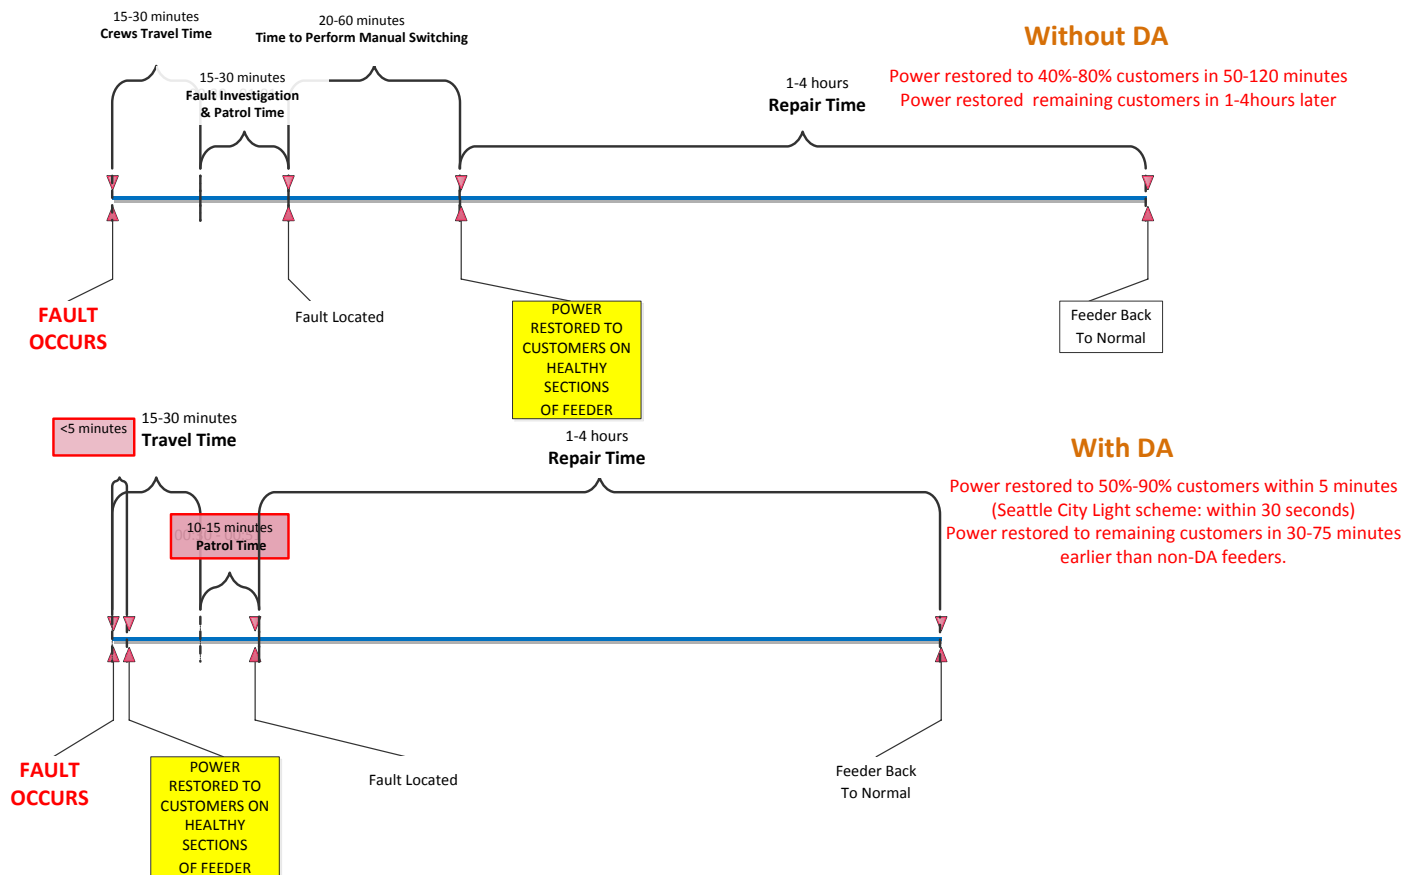

AGENDA

1. Distribution automation background
2. Seattle City Light pilot project
3. System performance – windstorm 08/29/15
4. Lessons learned

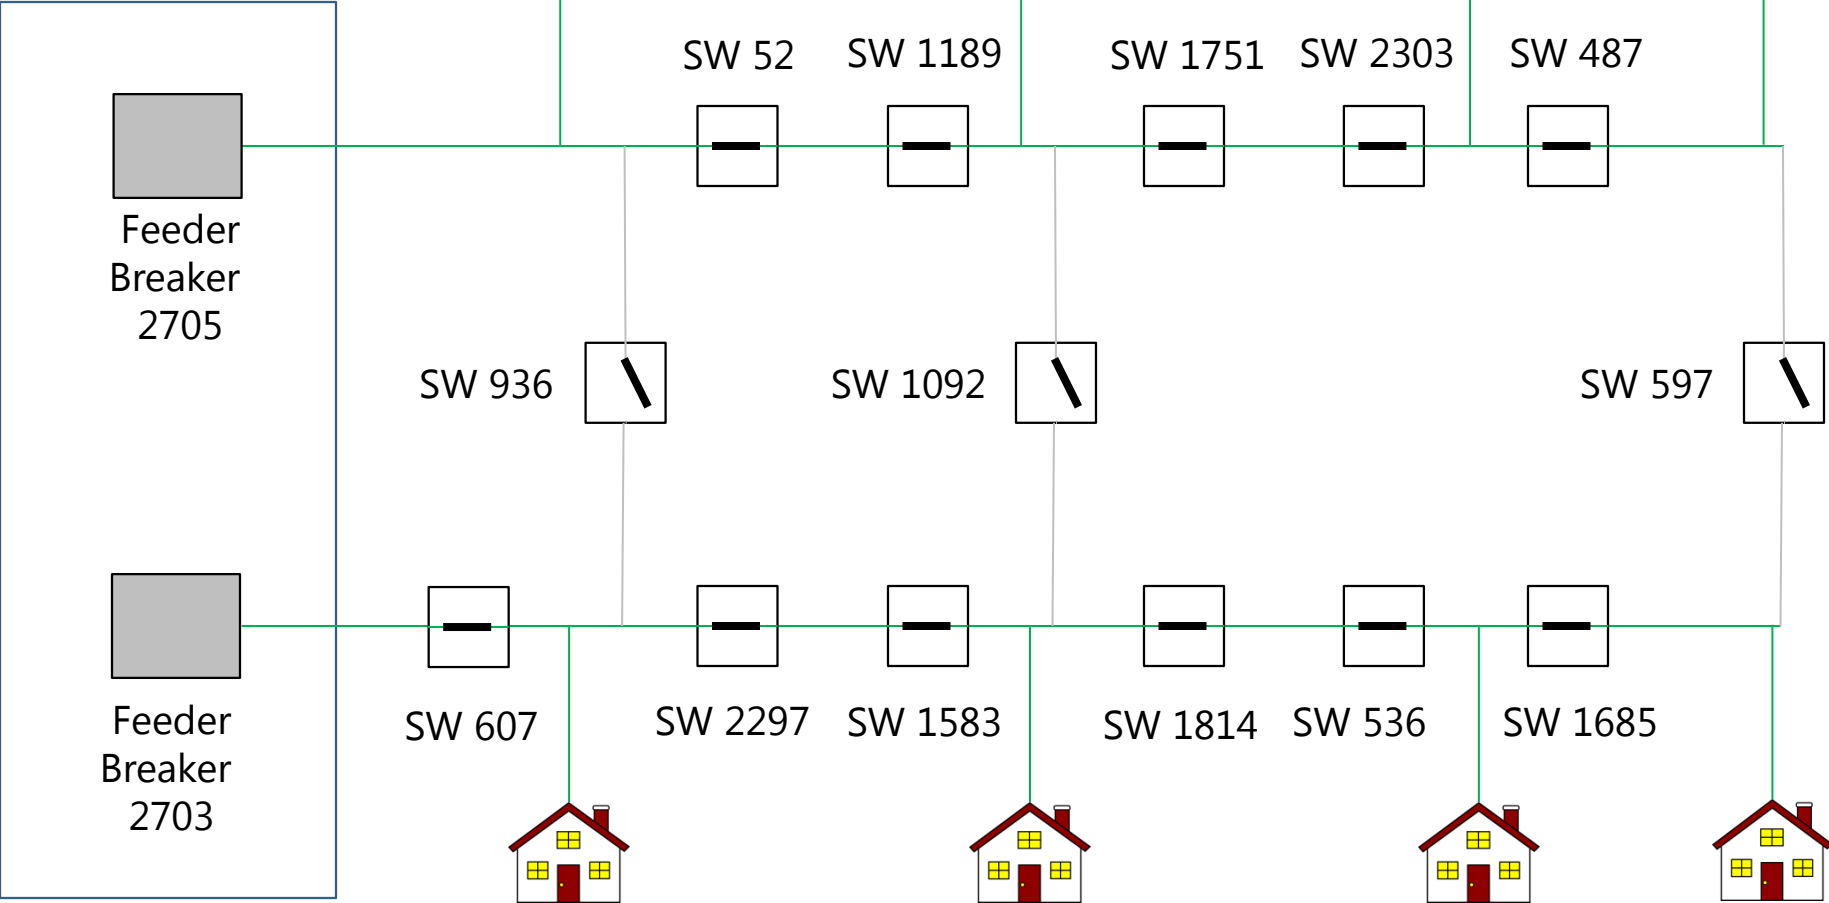

FAULT LOCATION, ISOLATION AND SERVICE RESTORATION (FLISR) SYSTEM

- Self-healing grid
- Distribution Automaton

RESTORATION TIME LINE WITH AND WITHOUT DA

Shoreline Substation

Event: System Normal

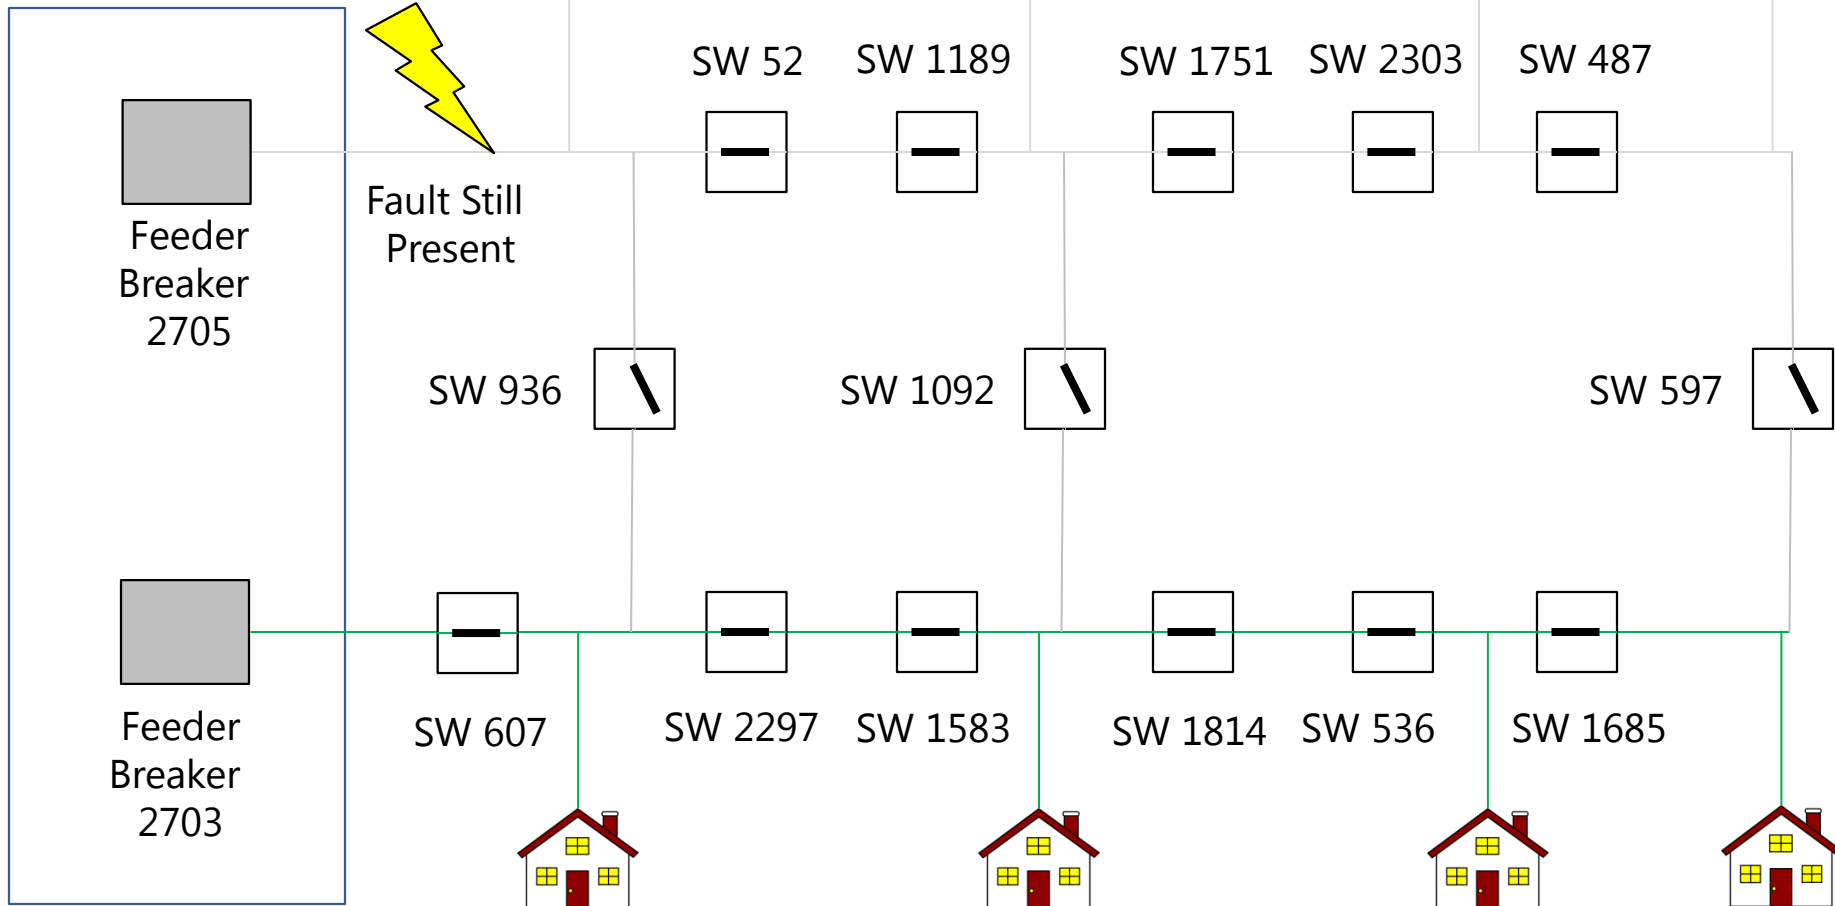

Shoreline Substation

Time : 0 Seconds

Event: Fault appear-
FDR BKR Trip

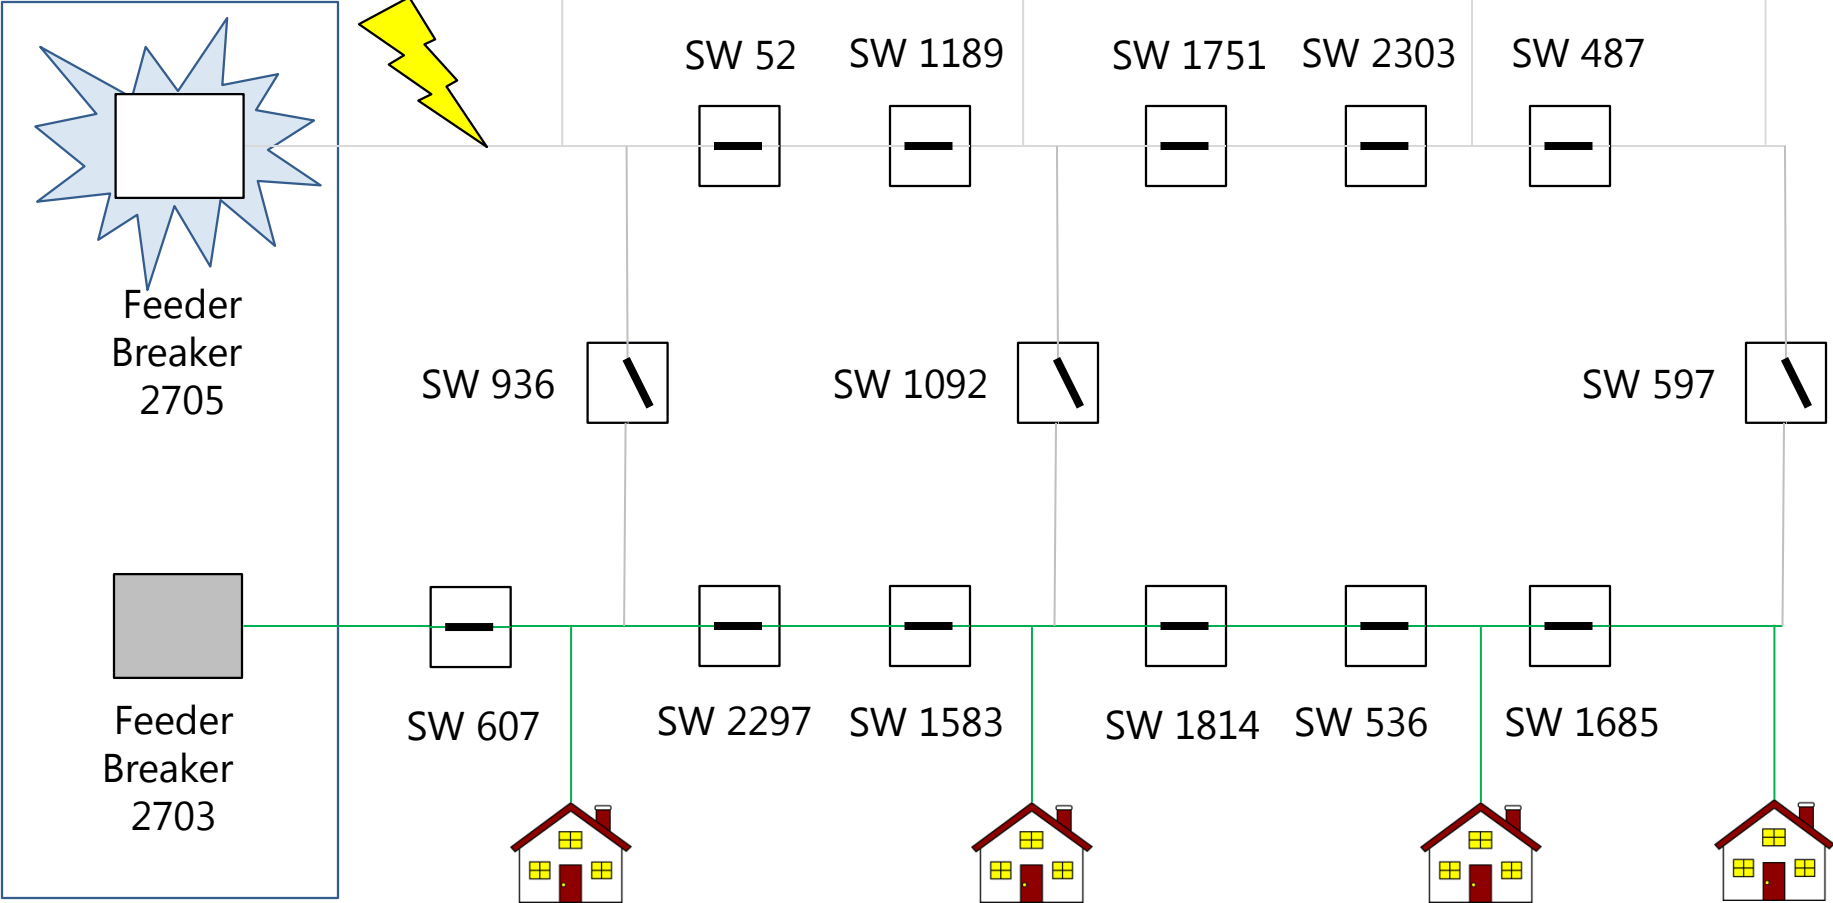

Shoreline Substation

Time : 4 Seconds

Event: FDR BKR
Reclose Attempt #1

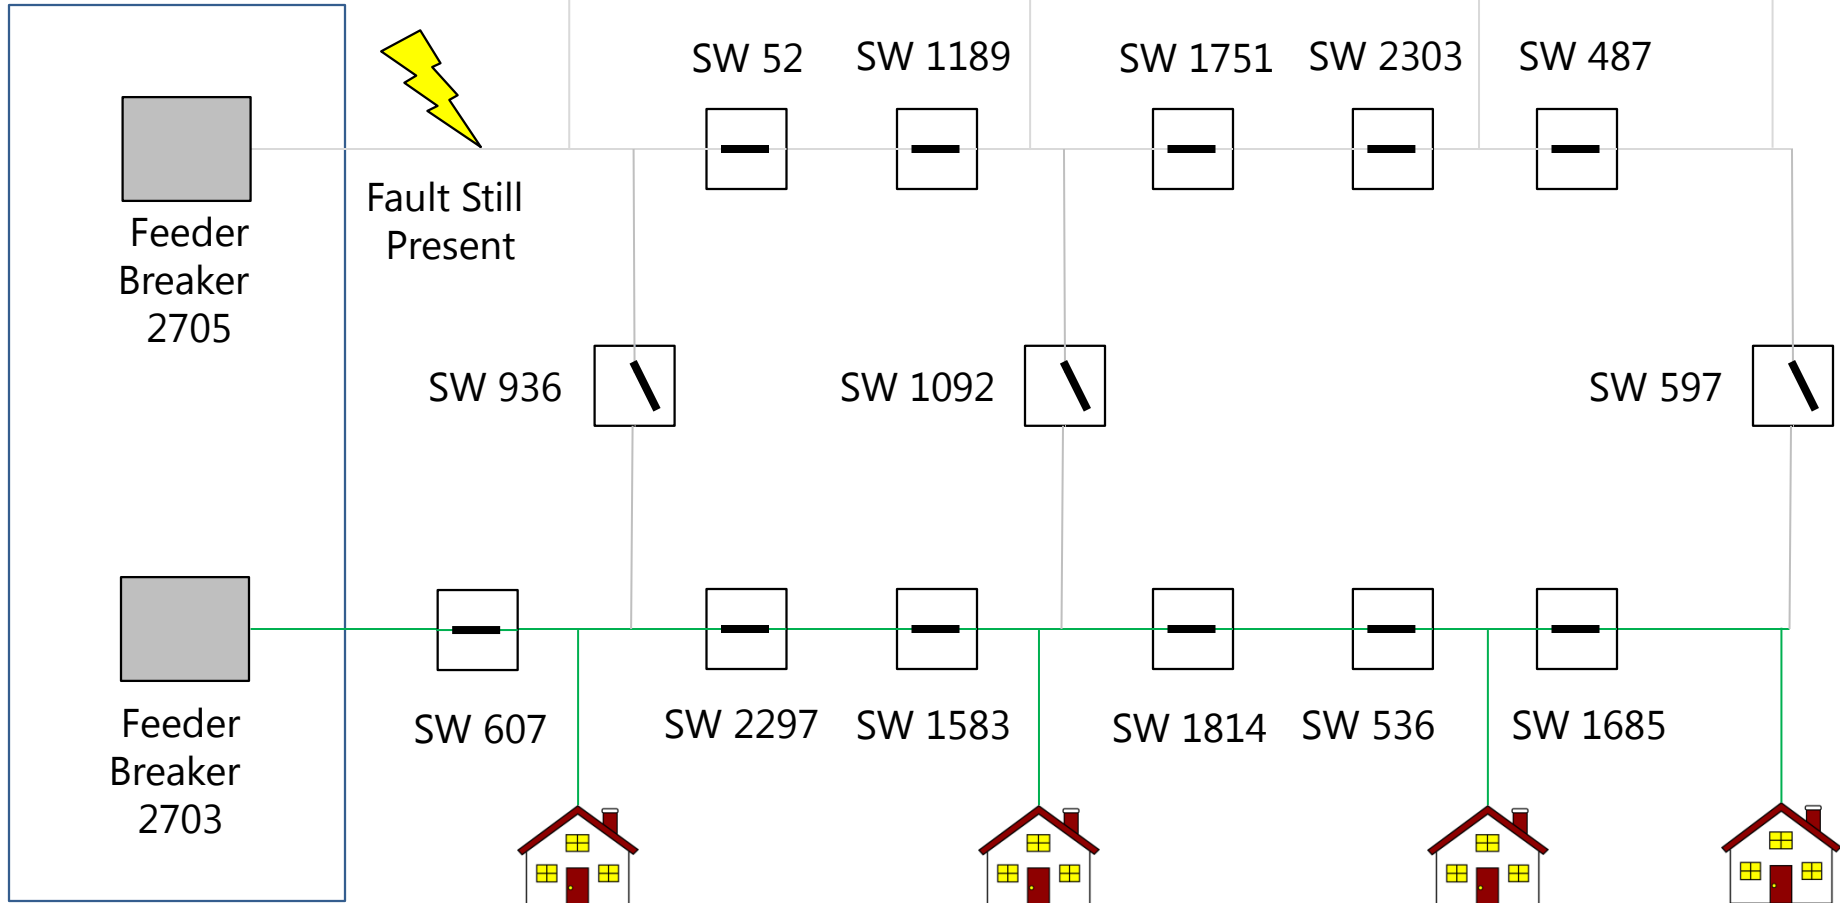

Shoreline Substation

Time : 4 Seconds

Event: FDR BKR Trip

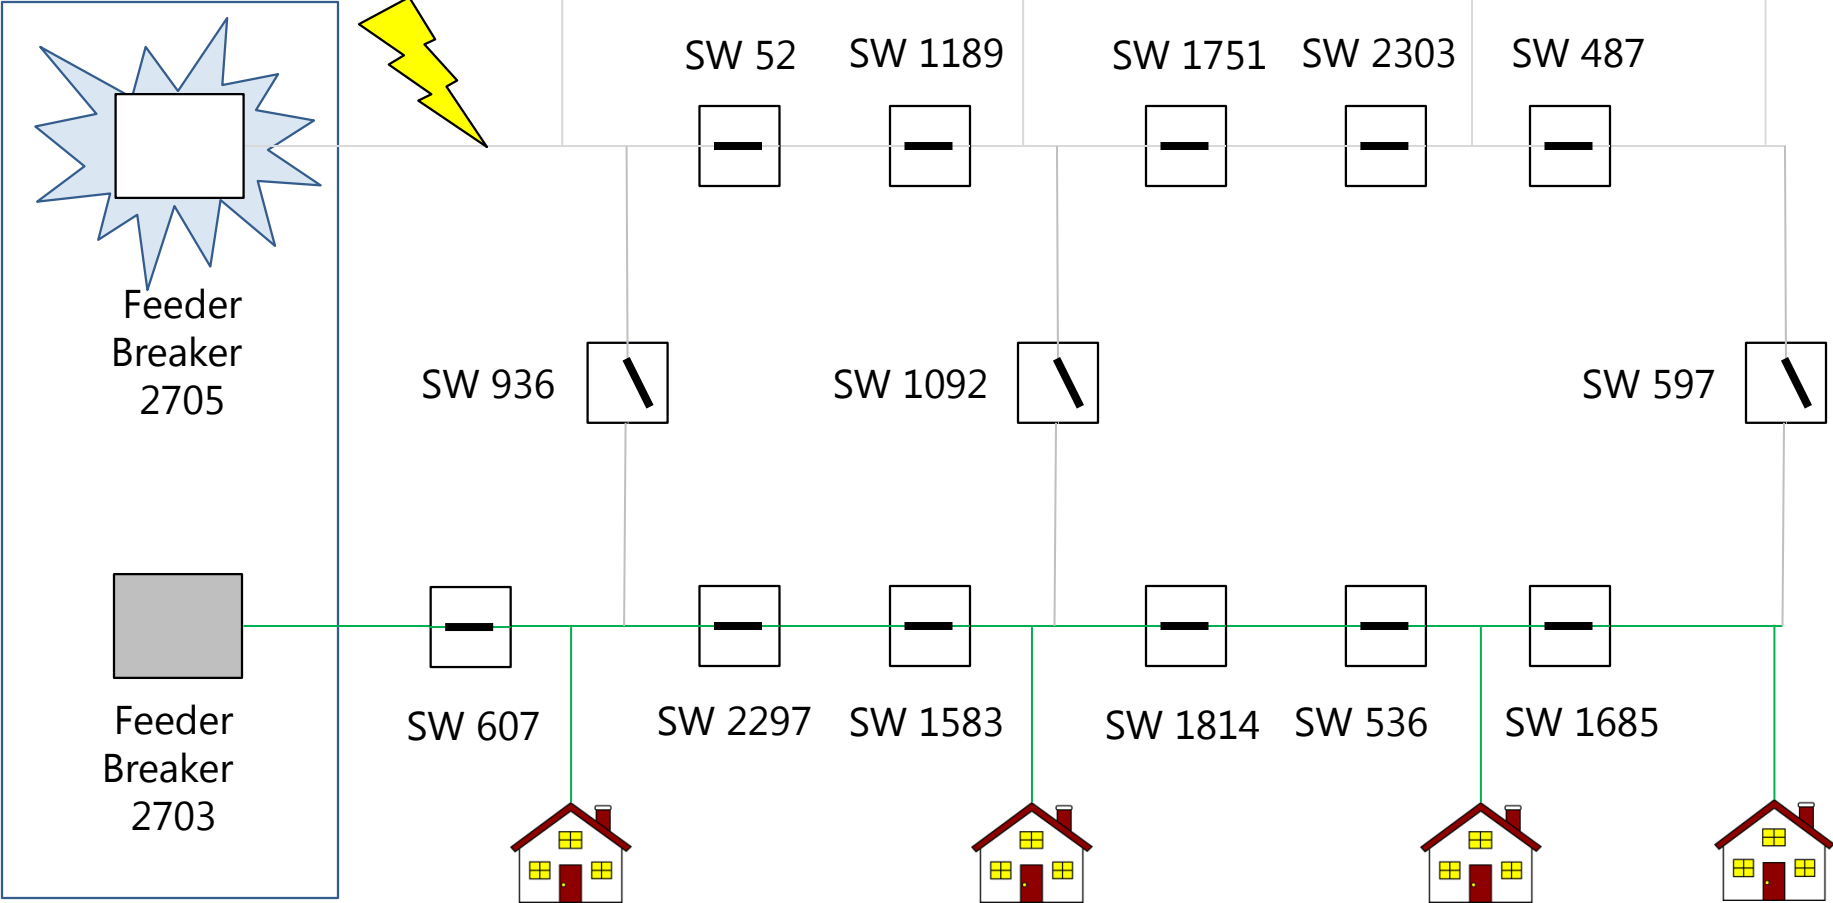

Shoreline Substation

Time : 19 Seconds

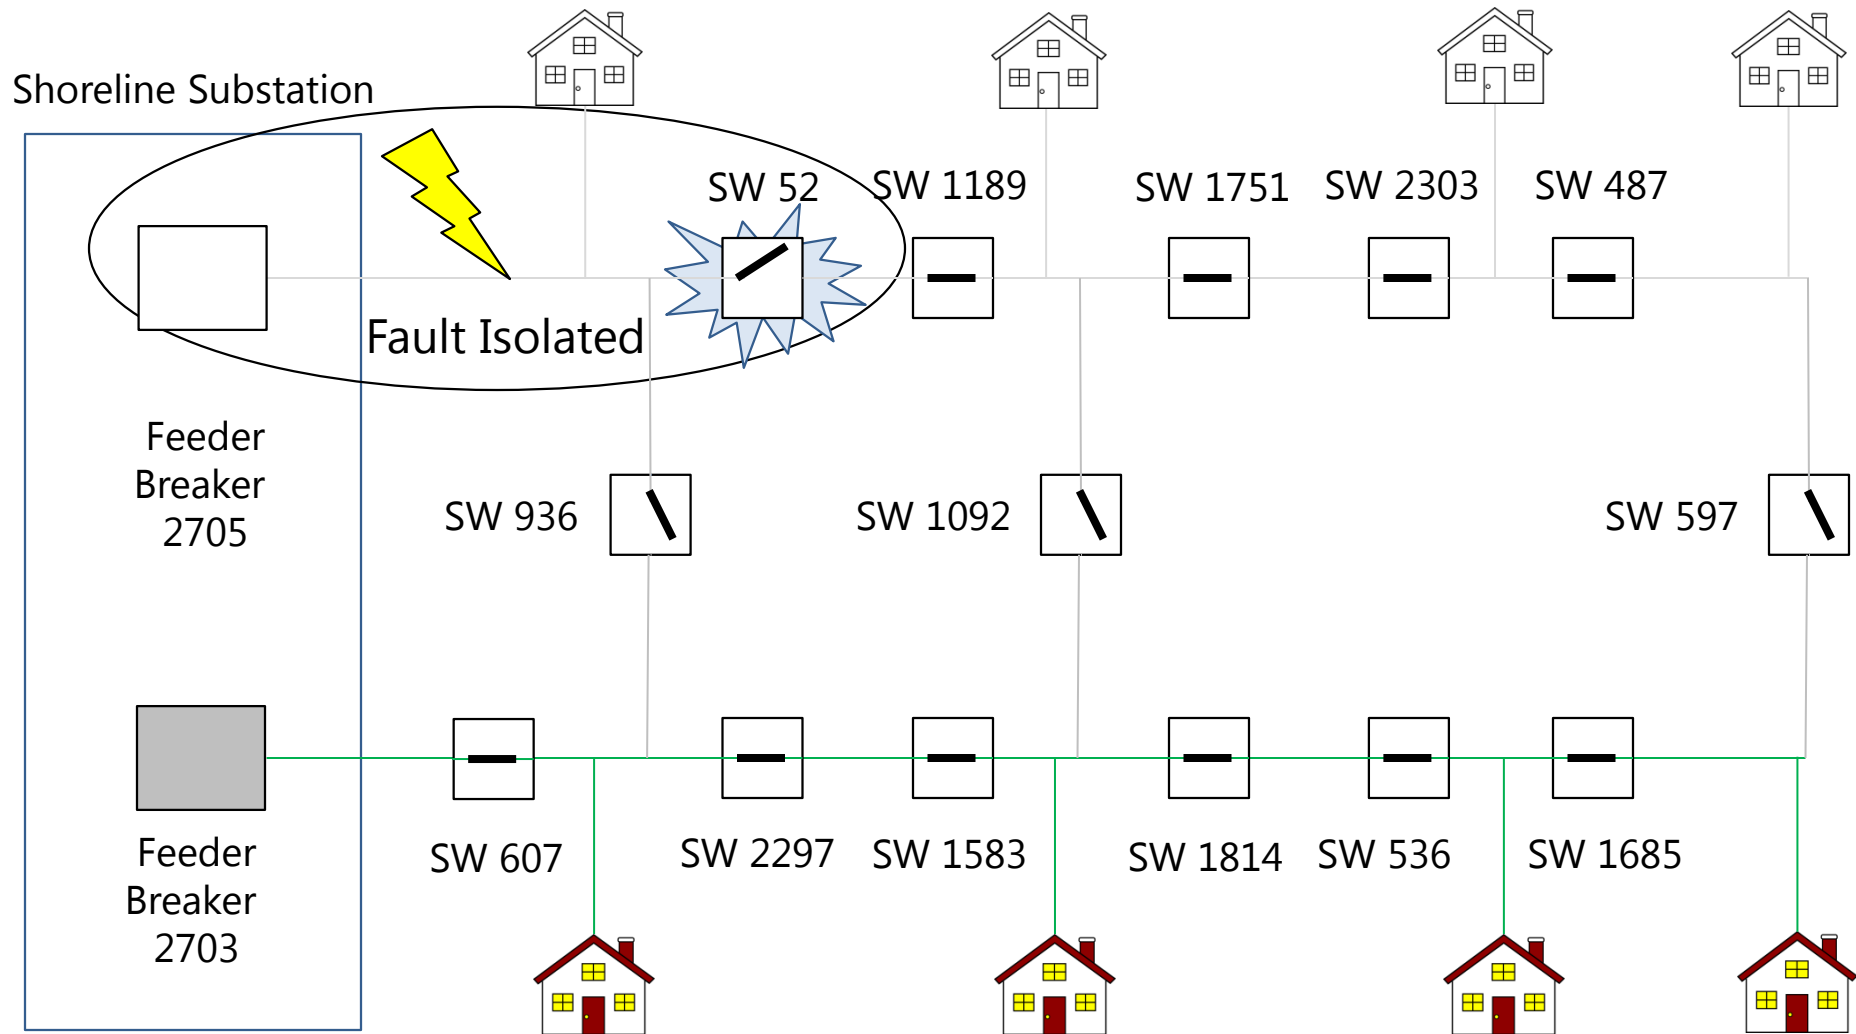

Event: FDR BKR
Reclose Attempt #2

Shoreline Substation

Time : 19 Seconds

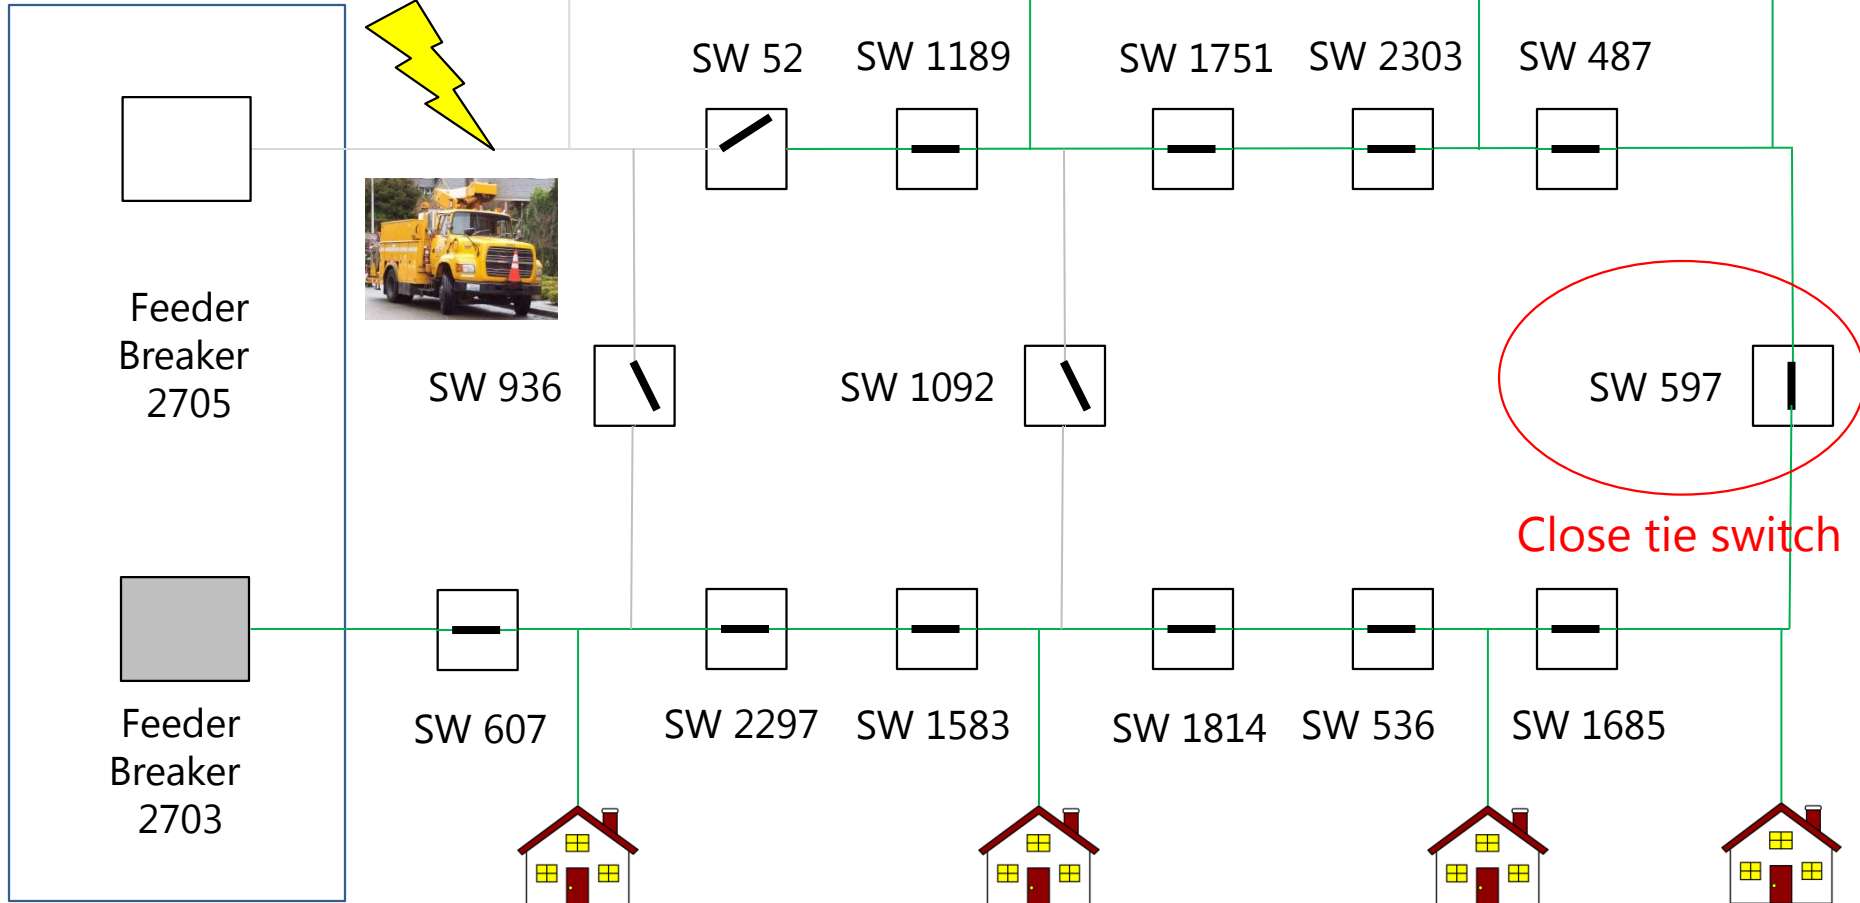

Event: FDR BKR Trip

Time : 25 Seconds

Event: SW 52 Trip

Shoreline Substation

Time : 30 Seconds

Event: Close tie SW,
restore power

DA- TWO BIG QUESTIONS:

- DA Intelligence Style
- Communication option

CENTRALIZED VS SUBSTATION CENTERED VS DISTRIBUTED INTELLIGENCE - 1

- Centralized intelligence

- Distribution Management System (DMS) serves as the “brain” of the DA system
- Full system view for restoration, optimize the restoration in the large scale.
- Integrate with other system and applications.
- Cons:
 - Longest deployment time
 - Integration with DMS, fine-tuning, are time-consuming
 - Expensive
 - Slowest restoration times
 - A point-to-multi-point system can be overwhelmed.

CENTRALIZED VS SUBSTATION CENTERED VS DISTRIBUTED INTELLIGENCE - 2

- Substation centered intelligence
 - Use main logic controls at the distribution substations
 - Pros and Cons are somewhere between Centralized and Distributed

CENTRALIZED VS SUBSTATION CENTERED VS DISTRIBUTED INTELLIGENCE - 3

- Distributed intelligence
 - Peer-to-Peer Devices
 - Fastest restoration
 - Fastest to deploy
 - Able to be deployed with or without DMS or GIS.
 - Cons:
 - Less efficient in large scale restoration optimization

COMMUNICATION

- Main Criteria:
 - Capacity & latency
 - Reliability
 - Cost
 - Security
 - Traffic types & networking standards
 - Reputation
 - Coverage
 - Other Smart Grids usage

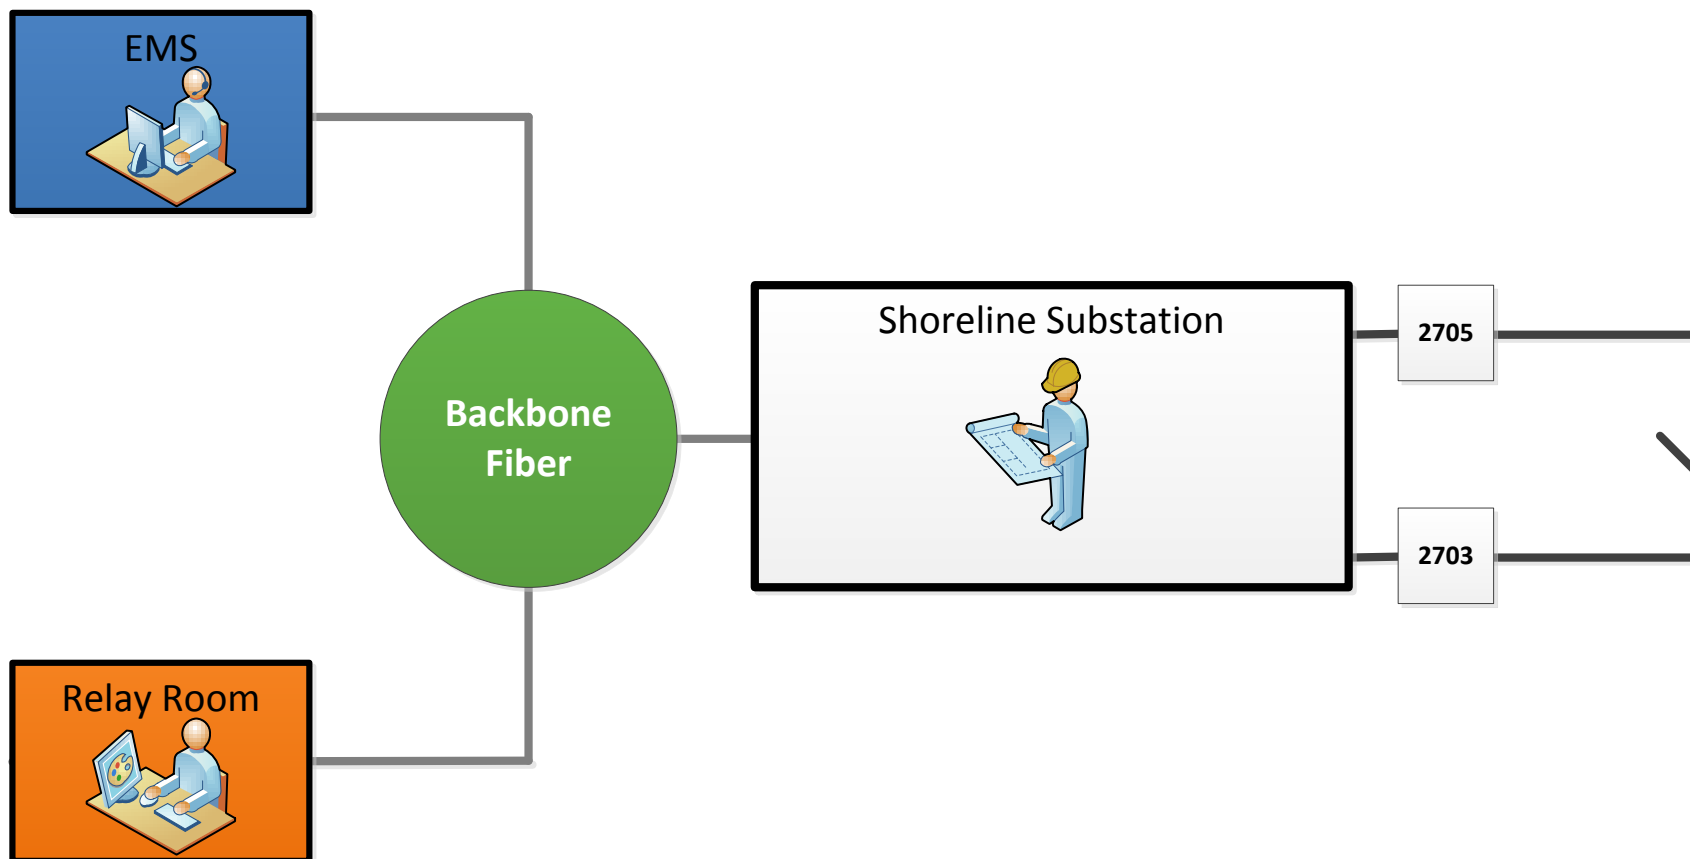

COMMUNICATION OPTIONS FOR DA

- Fiber
 - Wide bandwidth, fast, secure, reliable, well-established technology, lot of room for future growth, applications and for other Smart grid projects
 - Expensive
- Radio
 - Least expensive

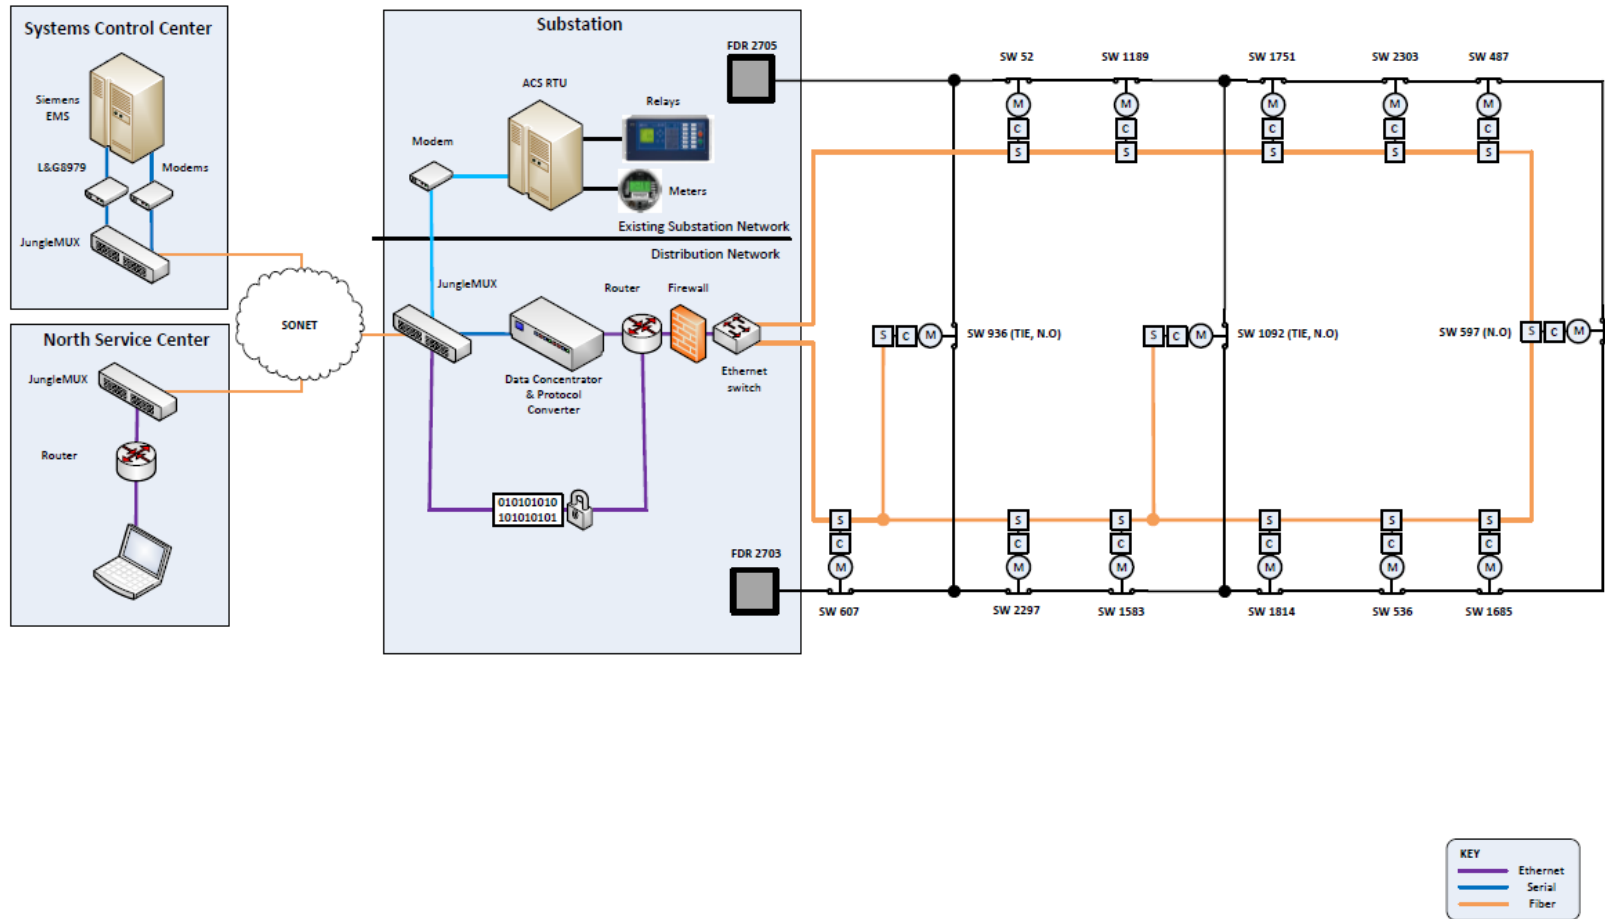

DA PILOT SYSTEM OVERVIEW

- Deployed on two feeders out of Shoreline substation: 2703 and 2705 at Shoreline & Lake Forest Park
- Utilizing distributed intelligence
- S&C ScadaMate switches
- Communication: fiber optics loop
- Integrated with EMS, PI historian
- Fully automated, supervisory and remote control
- Fast, secured remote access for relay technicians
- Online since 6:30 am 06/27/2015

SIMPLIFIED NETWORK DIAGRAM

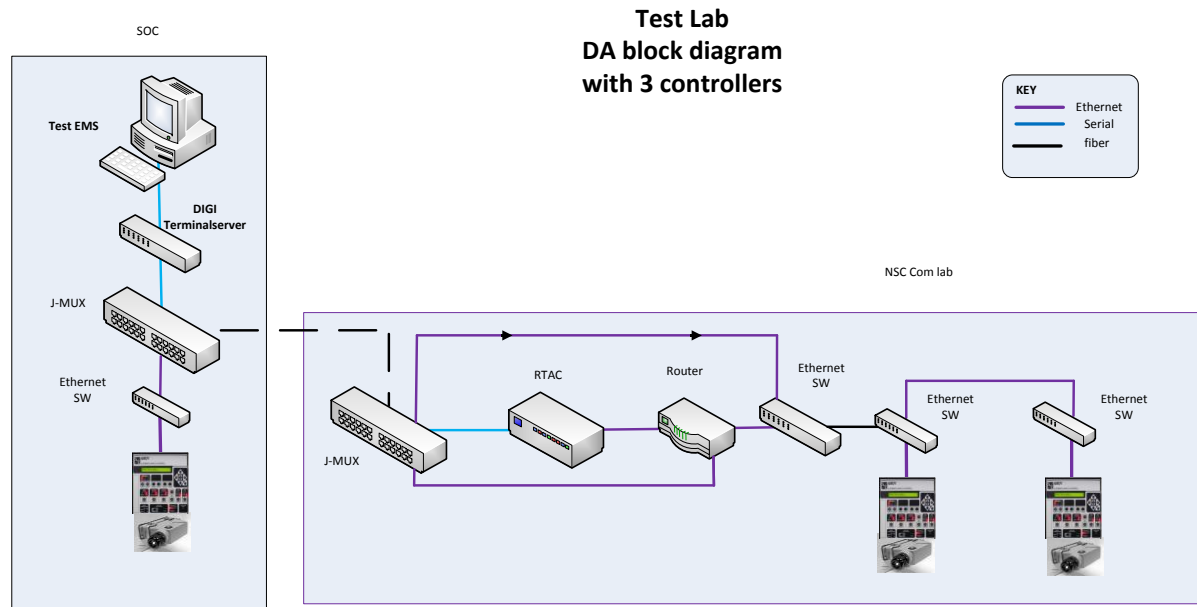

SHORELINE DA NETWORK DIAGRAM

LOOP COMMUNICATION FAULT RECOVER

- IEEE 802.1D Spanning Tree Protocol (STP)
 - Fault recovery time is too slow ~ one minute
- IEEE 802.1w Rapid Spanning Tree Protocol (RSTP)
 - Faster than STP, but still low for our scheme ~ few seconds
- Vendors' proprietary protocols
- Siemens' enhanced RSTP
 - Fast recovery time: in ms
- Interoperability

TEST LAB – DA BLOCK DIAGRAM

STANDARDIZATION

- Allows to program and configure devices in an efficient manner with minimal errors
- Familiarity from job to job for engineers, constructions crews, communication and relay technicians
- Reduce debugging time.
- IP, DNP, Modbus, point lists
- Naming convention
- Equipment, constructions.

NEW DESIGN SCADAMATE SWITCH WITH GROUND LEVEL DISCONNECT HANDLE

GROUND LEVEL DISCONNECT HANDLE

SUMMER STORM 08/29/2015

- <http://cliffmass.blogspot.com/2015/08/the-strongest-summer-storm-in-northwest.htm>
- **The Strongest Summer Storm In Northwest History**
- Saturday was a historic day during a historic summer.
On that day western Oregon and Washington was lashed by the **strongest summer windstorm in its historic record.**

WINDSTORM 08/29/2015

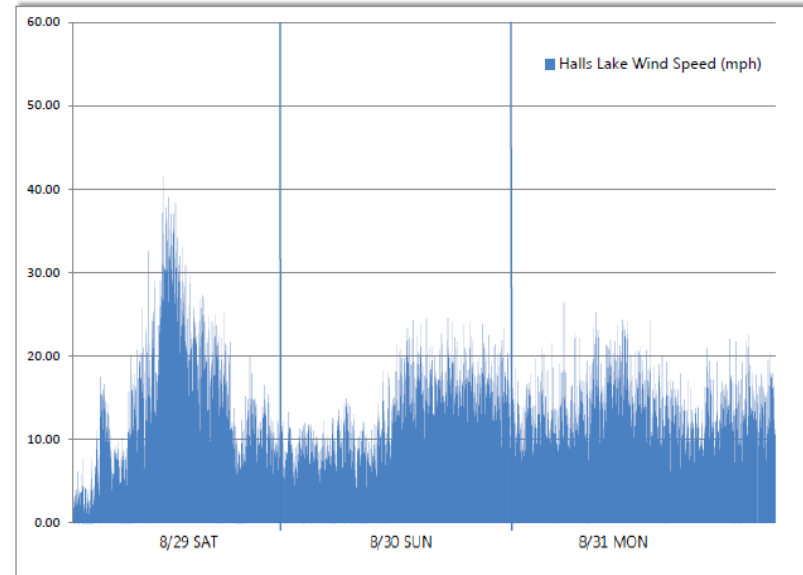

WIND SPEED

WIND SPEED REPORT FROM UW

MAX GUST SPEED (MPH)			
Date	Time	Speed	Gust
8/29/2015	12:52	16.9	50.6

WIND SPEED REPORT FROM SNOPUD

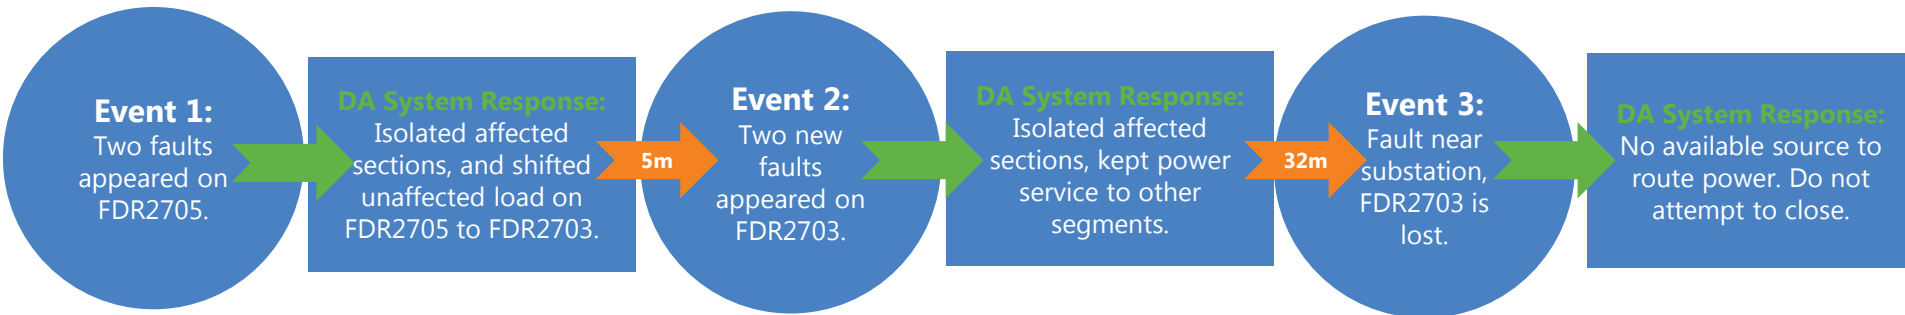

MAX GUST SPEED (MPH)			
Date	Time	Speed	Gust
8/29/2015	12:23	NA	41.6

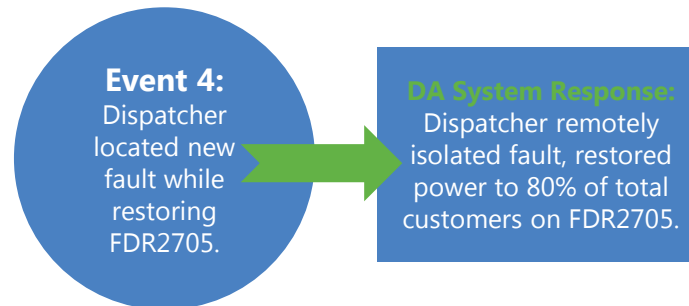

WINDSTORM DIAGNOSTIC OVERVIEW

- The DA system handled four different storm contingencies and executed logic to mitigate as many customer outages as possible.
- In both automatic and manual modes, the system functioned properly.

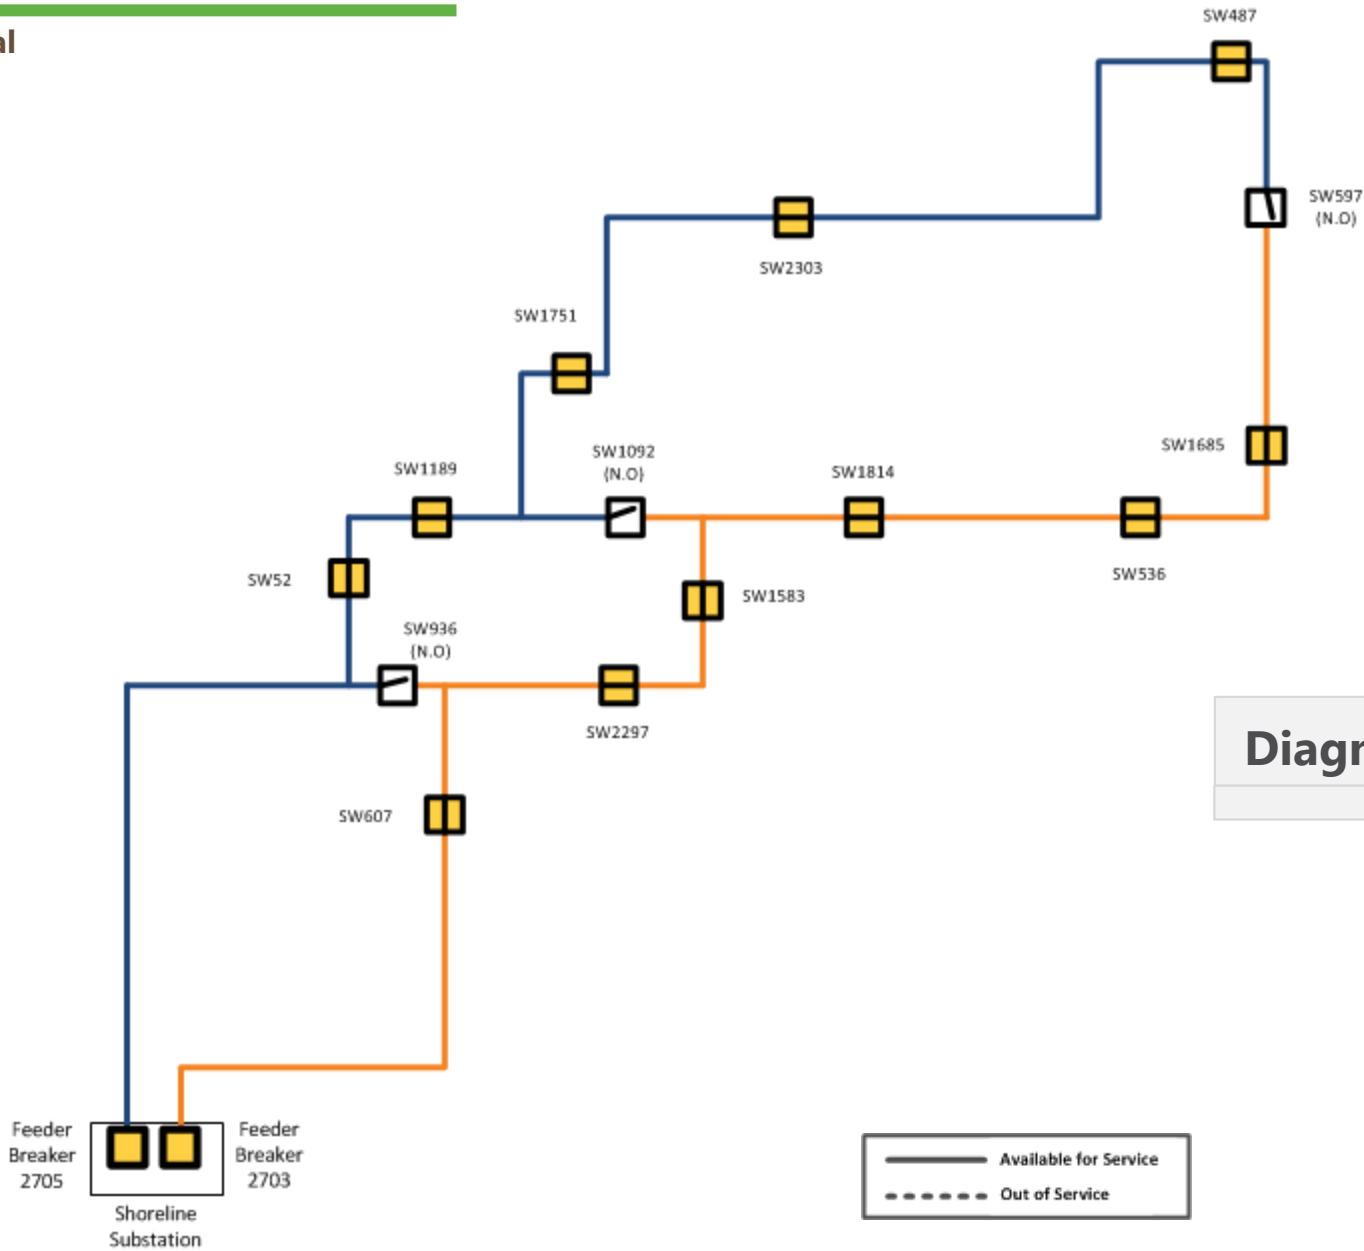

Automatic Mode

Manual Mode

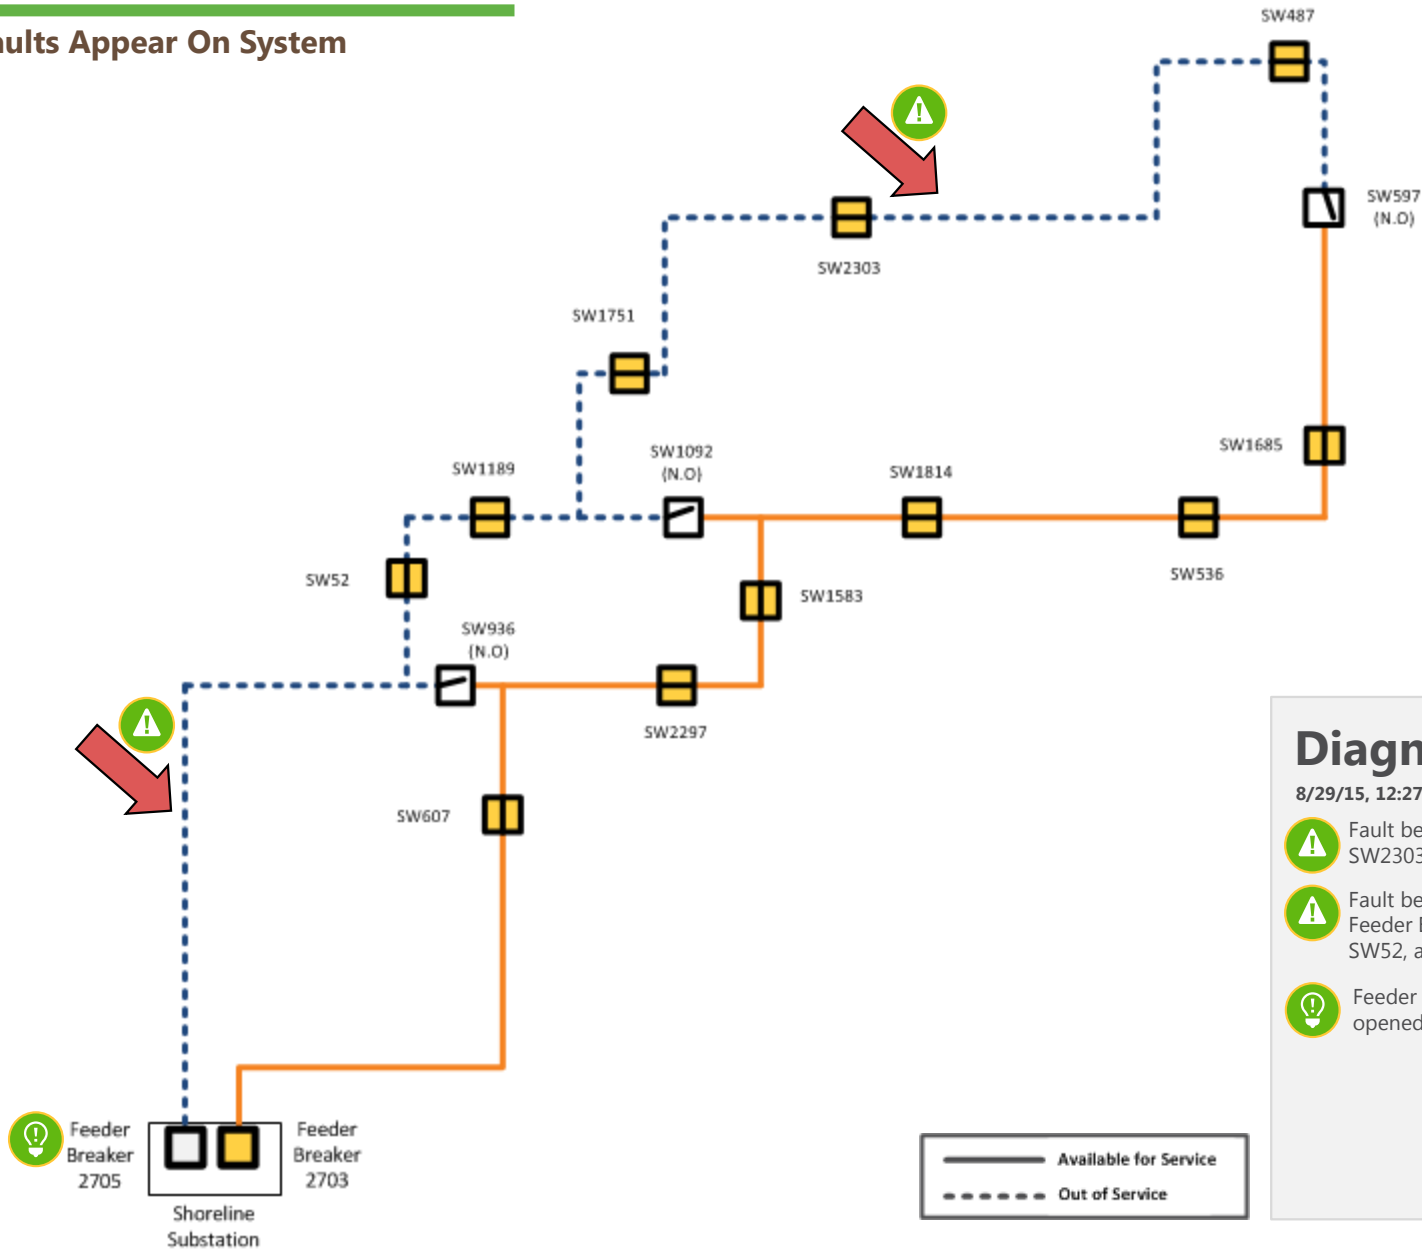

System Normal

Diagnostics

08/2015 WINDSTORM

Event 1: Faults Appear On System

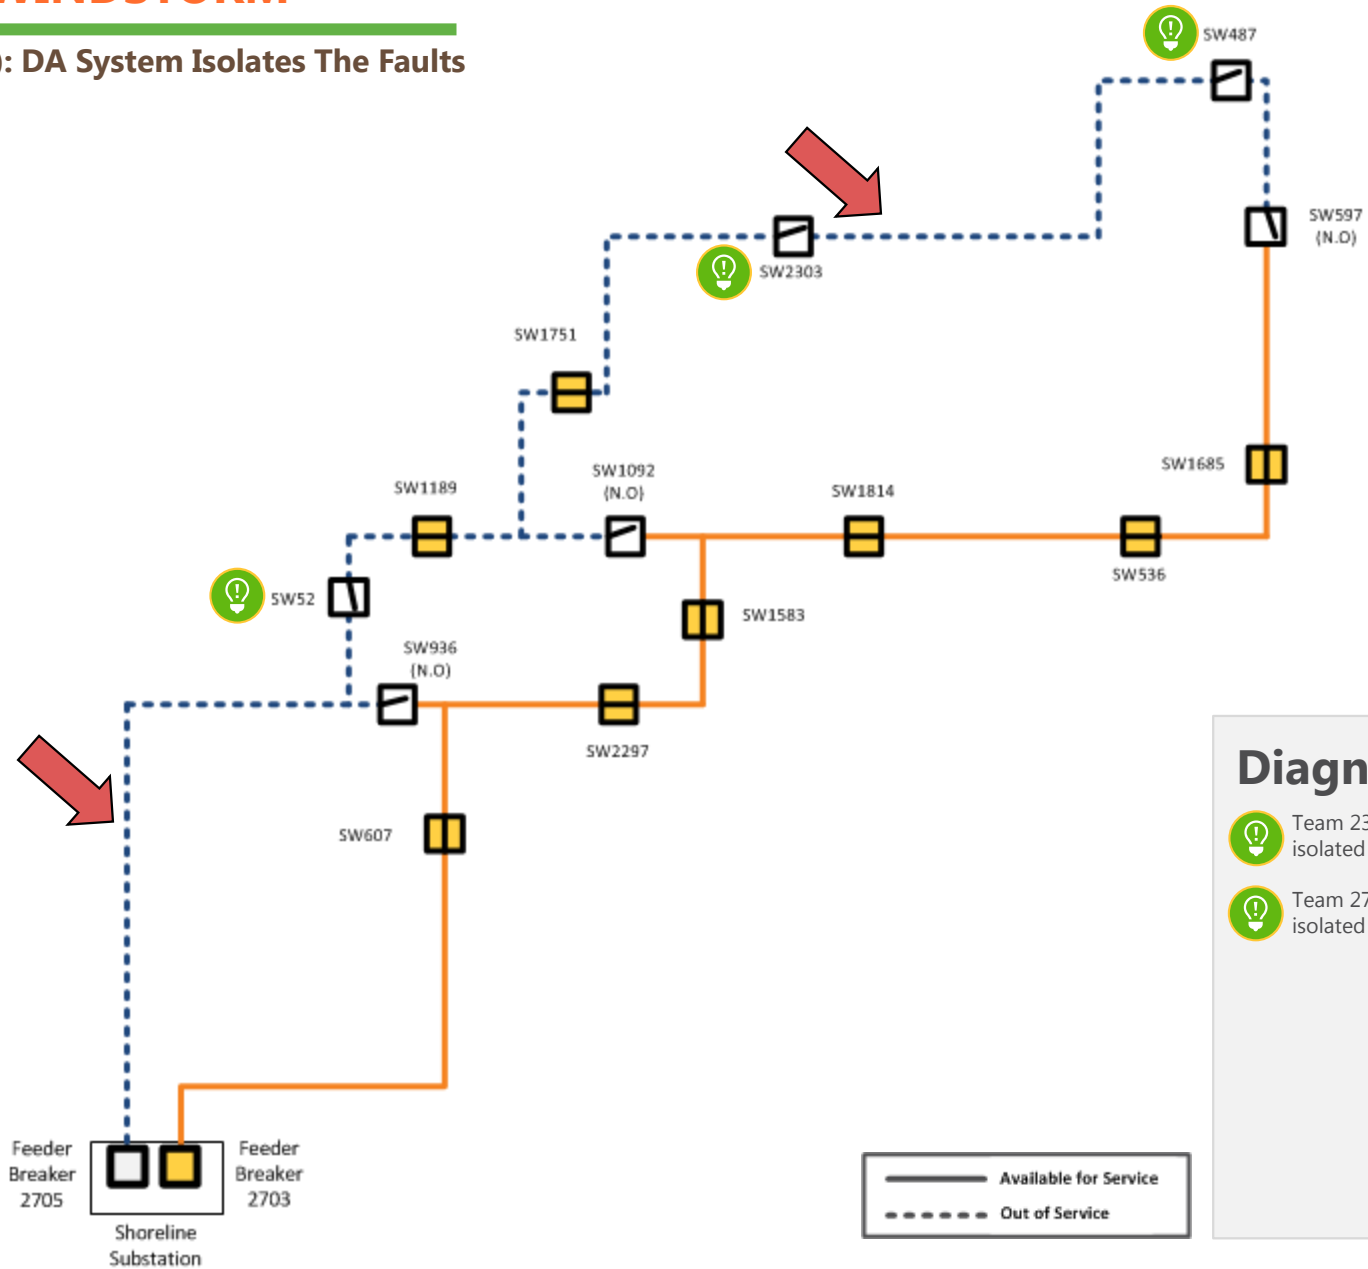

Diagnostics

8/29/15, 12:27pm

- Fault between SW2303 and SW487.
- Fault between Feeder Breaker 2705, SW52, and SW936.
- Feeder Breaker 2705 opened.

08/2015 WINDSTORM

Event 1 (cont.): DA System Isolates The Faults

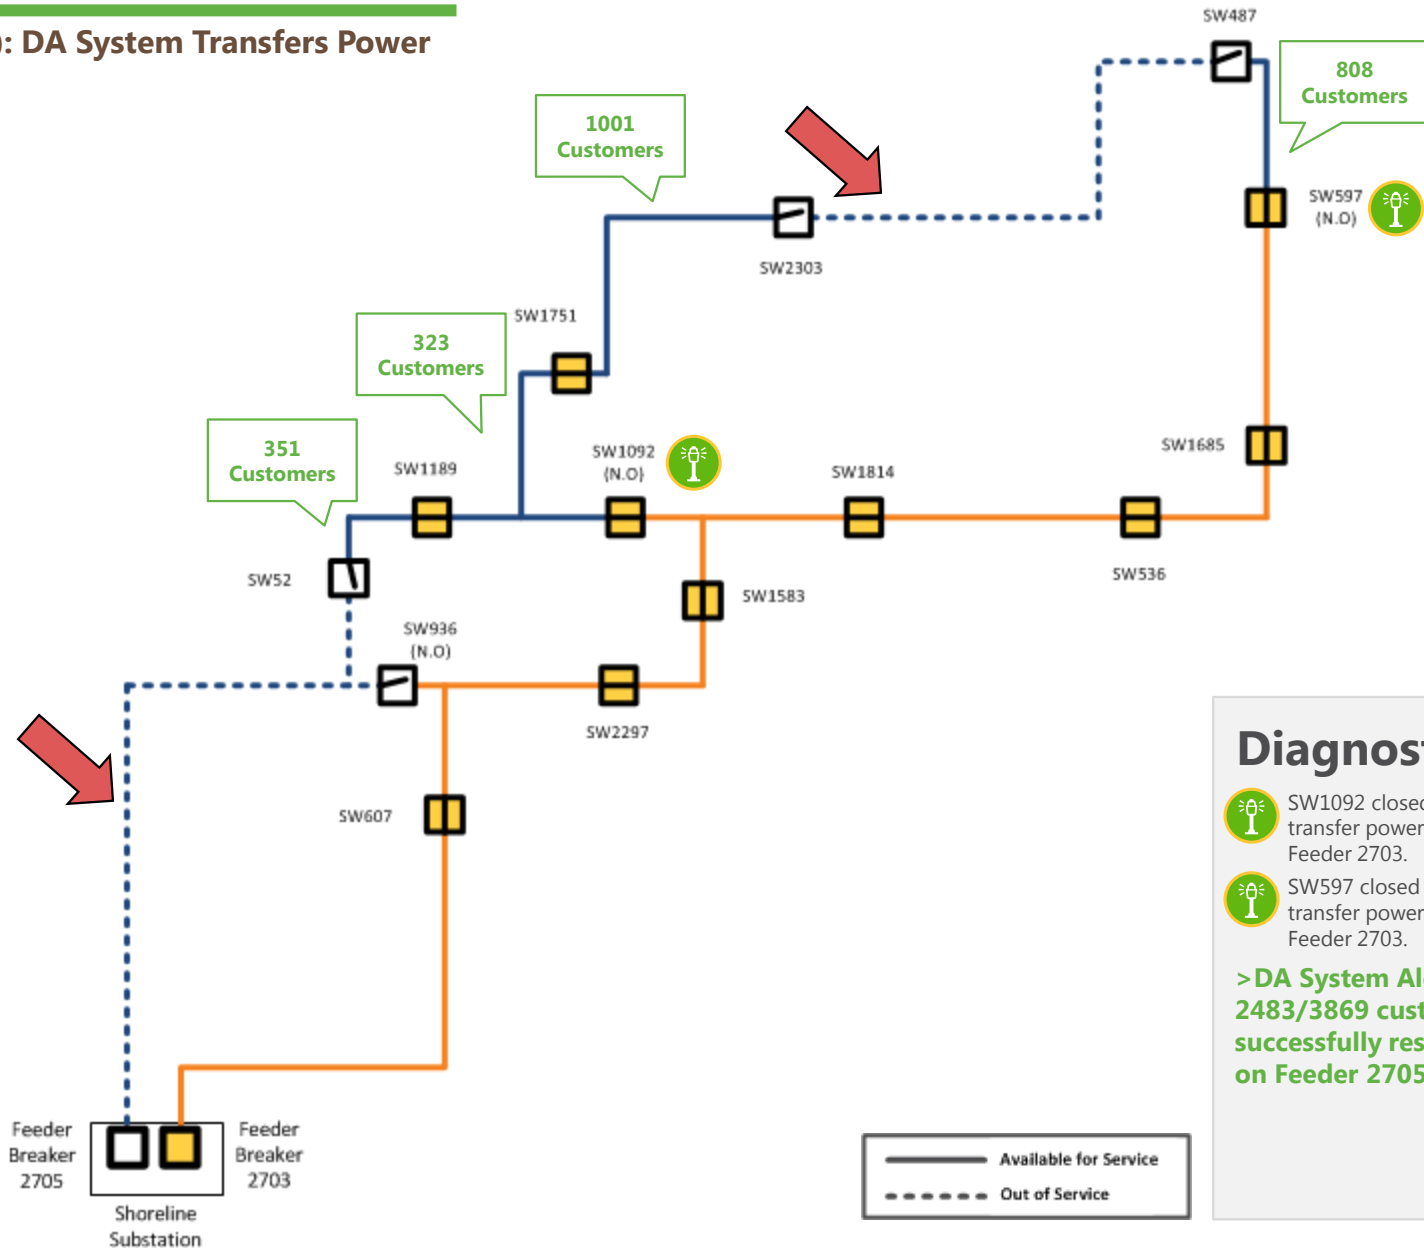

Diagnostics

-  Team 2303-487 isolated the fault.
-  Team 2705-52-936 isolated the fault.

08/2015 WINDSTORM

Event 1 (cont.): DA System Transfers Power

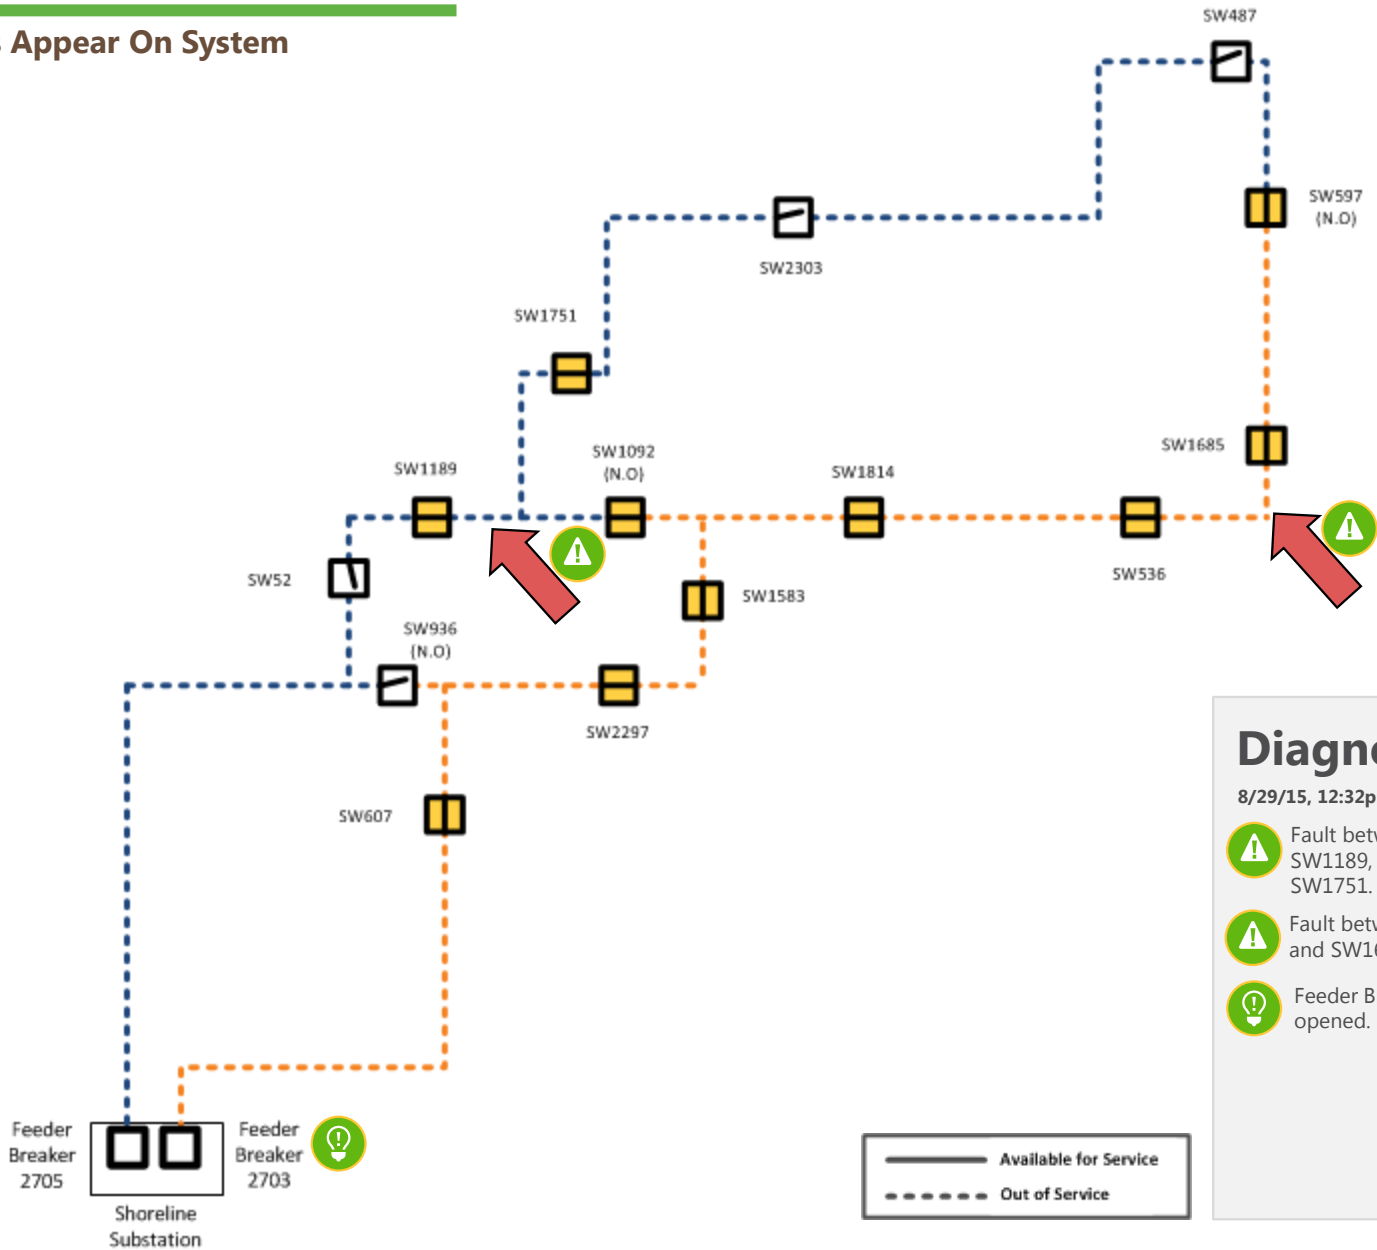

Diagnostics

- SW1092 closed to transfer power from Feeder 2703.
- SW597 closed to transfer power from Feeder 2703.

> DA System Alert:
2483/3869 customers successfully restored on Feeder 2705.

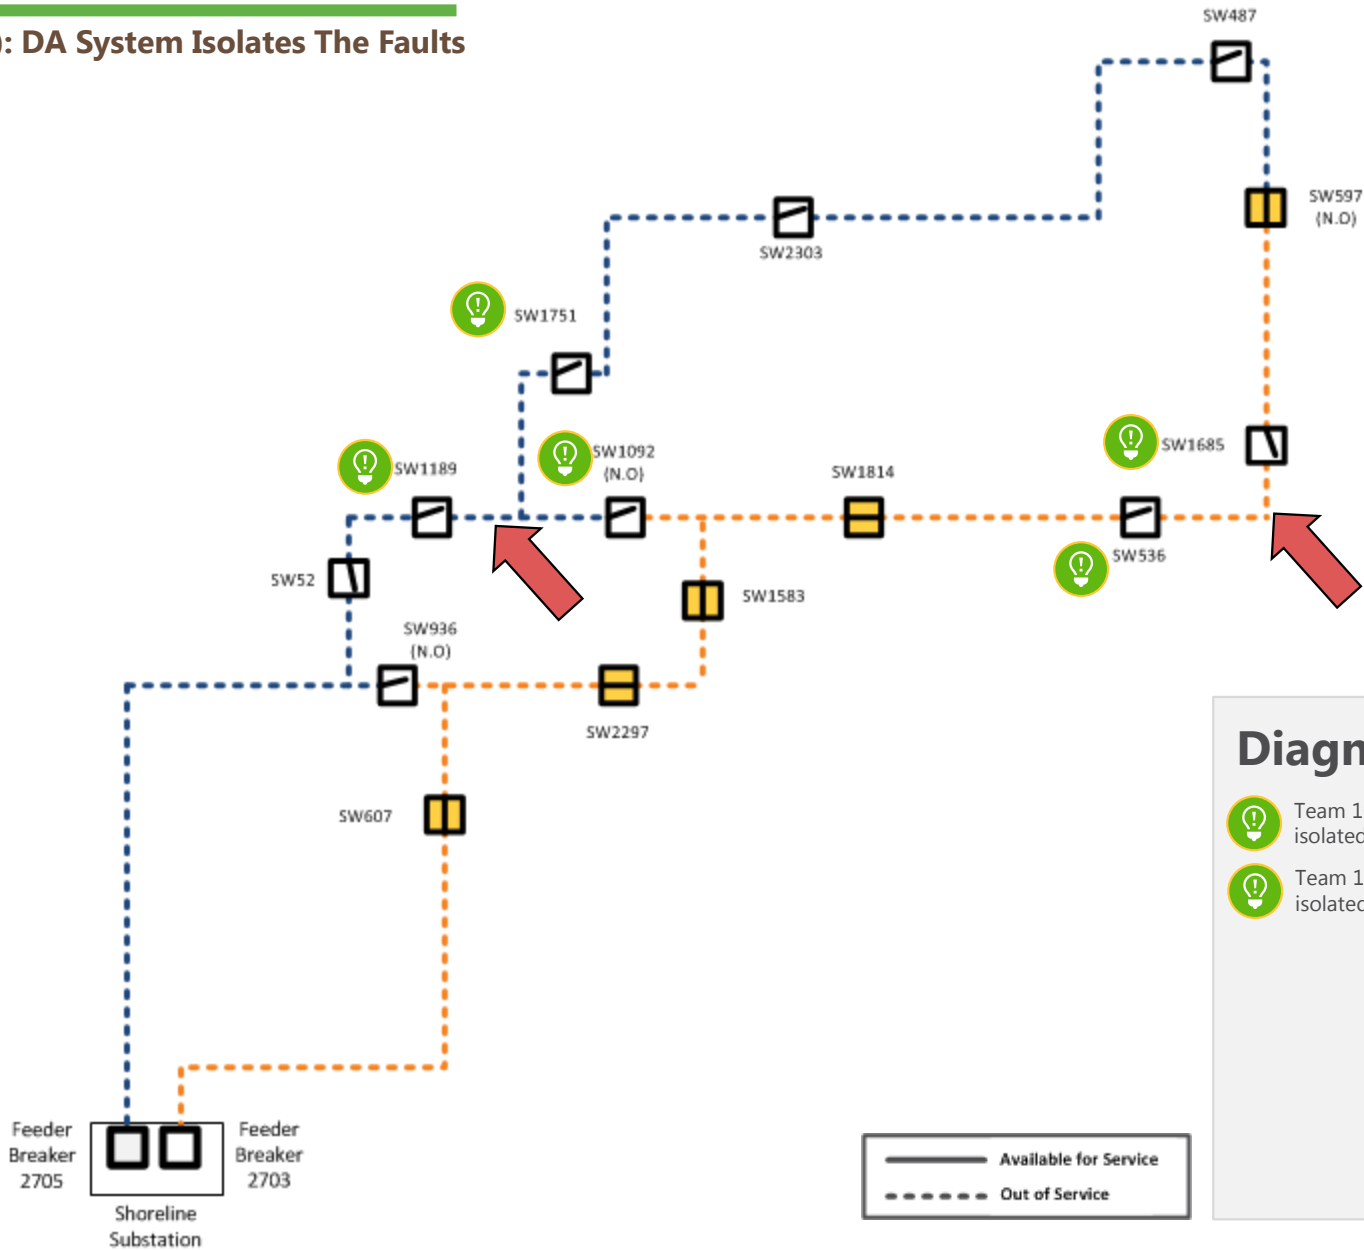

08/2015 WINDSTORM

Event 2: Faults Appear On System

08/2015 WINDSTORM

Event 2 (cont.): DA System Isolates The Faults

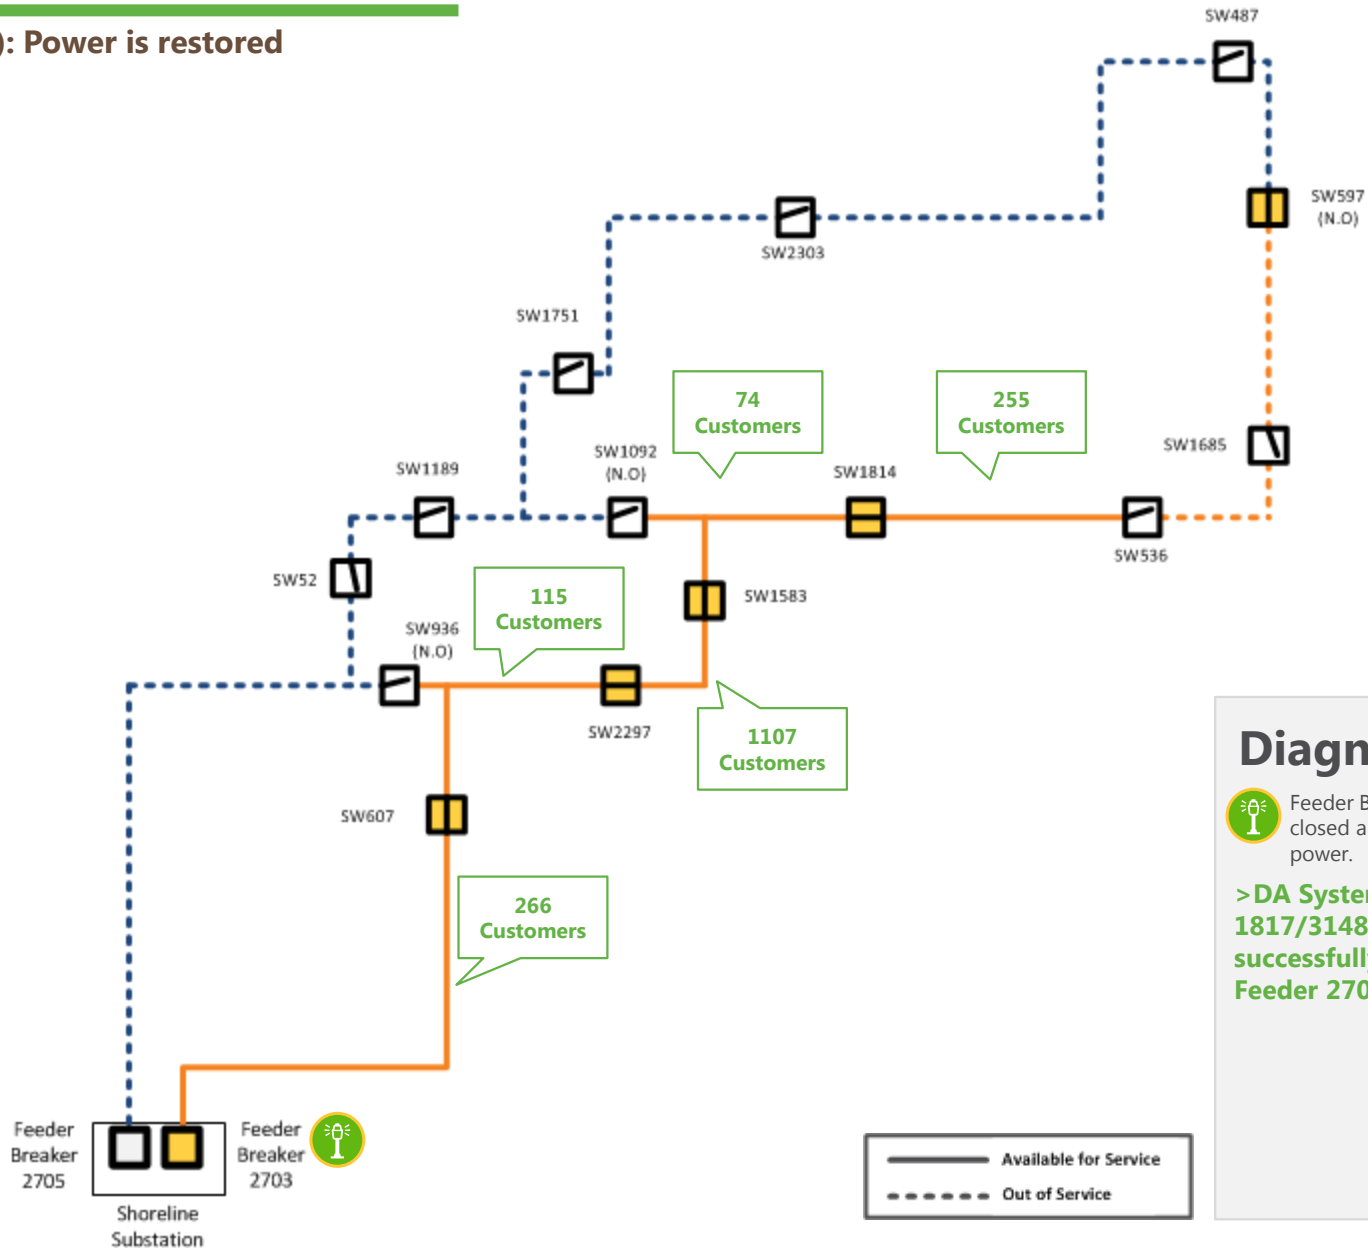

Diagnostics

- Team 1092-1189-1751 isolated the fault.
- Team 1685-536 isolated the fault.

08/2015 WINDSTORM

Event 2 (cont.): Power is restored

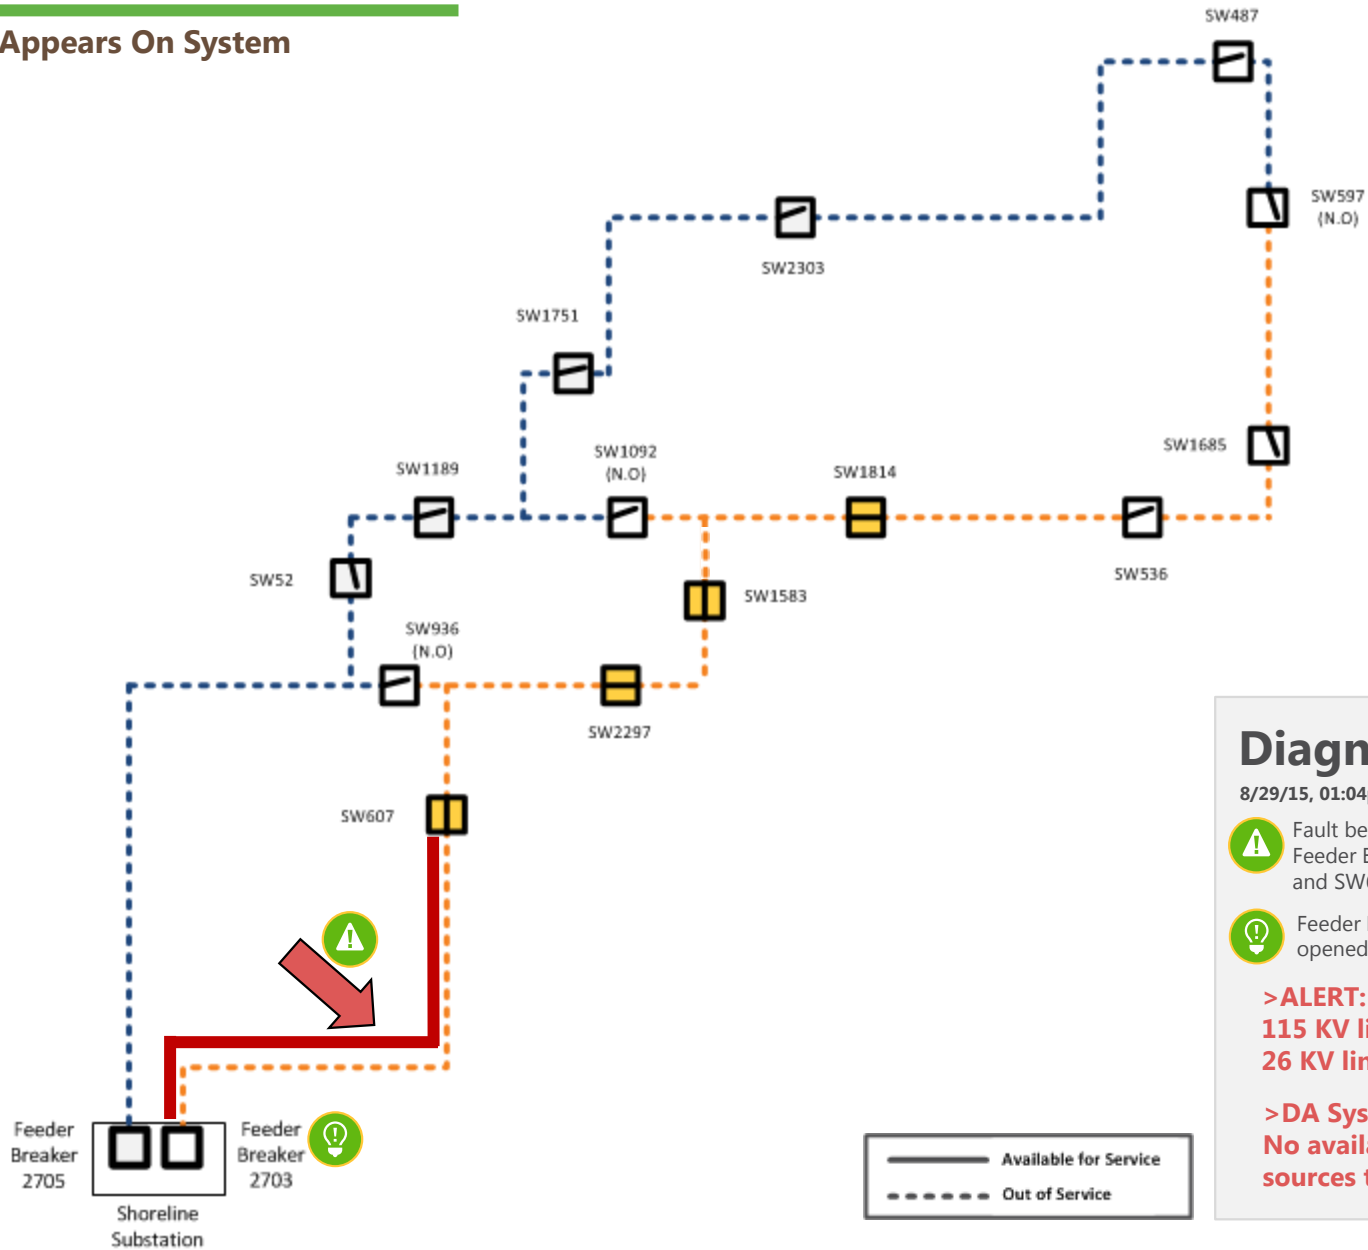

Diagnostics

 Feeder Breaker 2703 closed and restored power.

>DA System Alert:
1817/3148 customers successfully restored on Feeder 2703.

08/2015 WINDSTORM

Event 3: Fault Appears On System

Diagnostics

8/29/15, 01:04pm

 Fault between Feeder Breaker 2703 and SW607.

 Feeder Breaker 2703 opened.

>ALERT:
115 KV line fell onto 26 KV line.

>DA System Alert:
No available power sources to reroute.

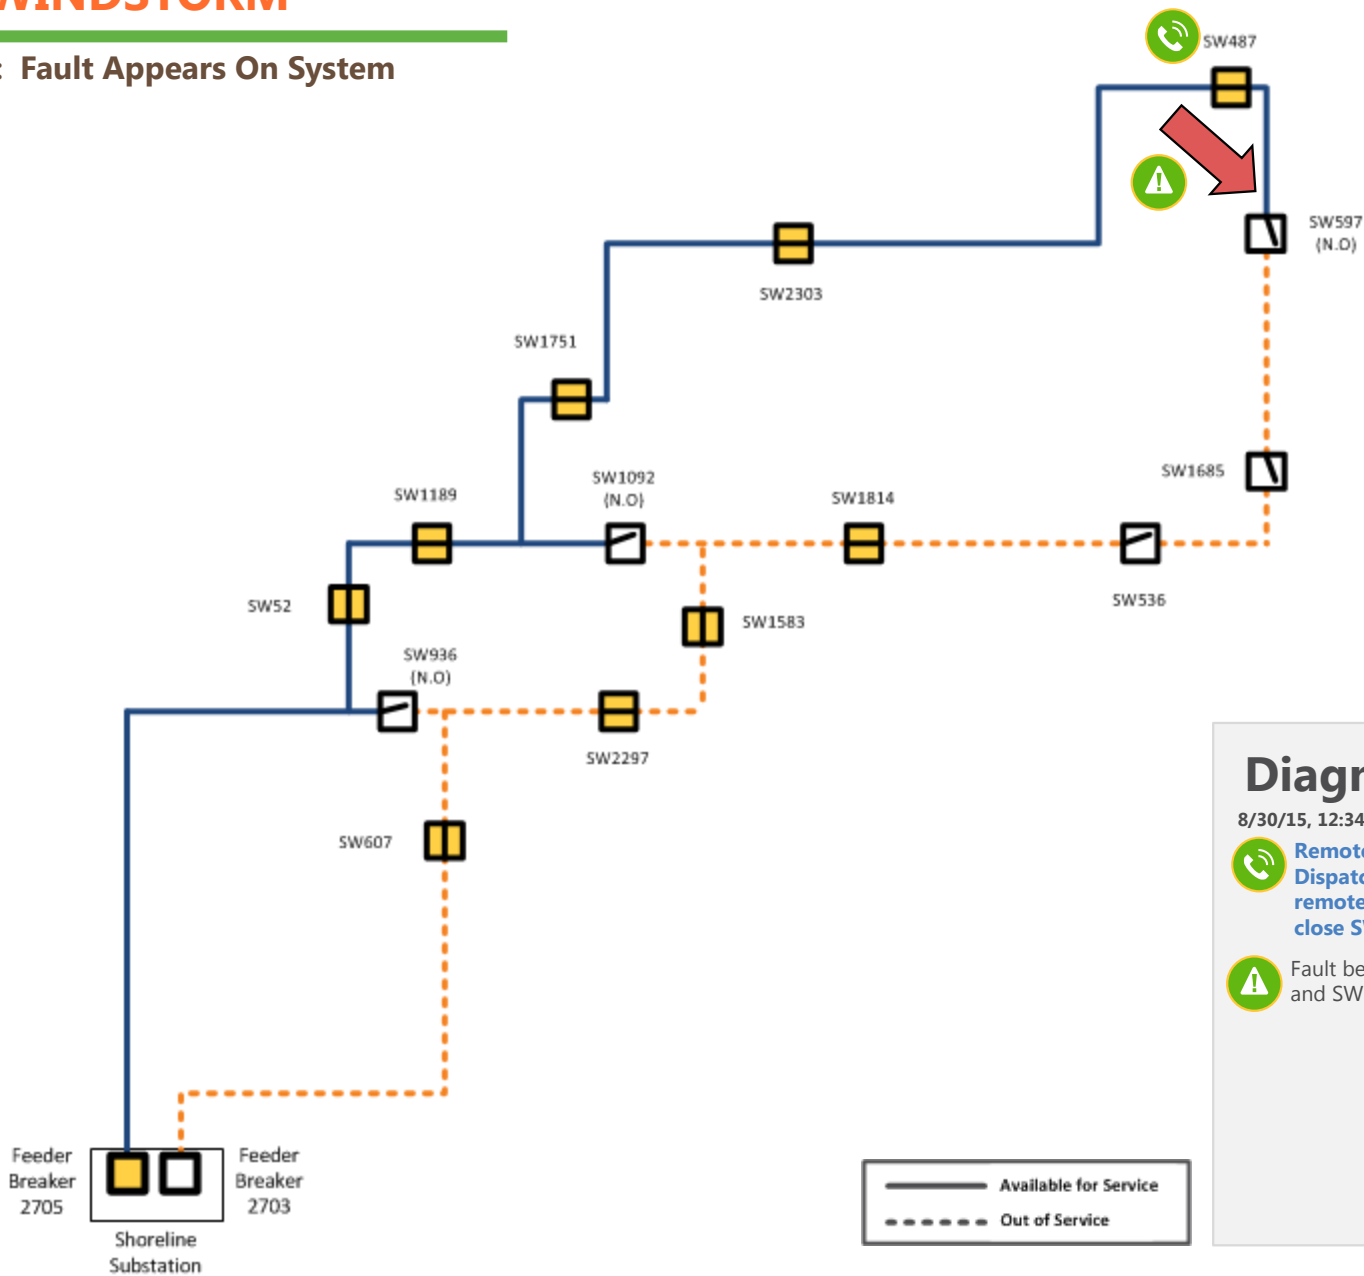

08/2015 WINDSTORM

Event 4: Crews Work On Restoring Feeder 2705

08/2015 WINDSTORM

Event 4 (cont.): Fault Appears On System

Diagnostics

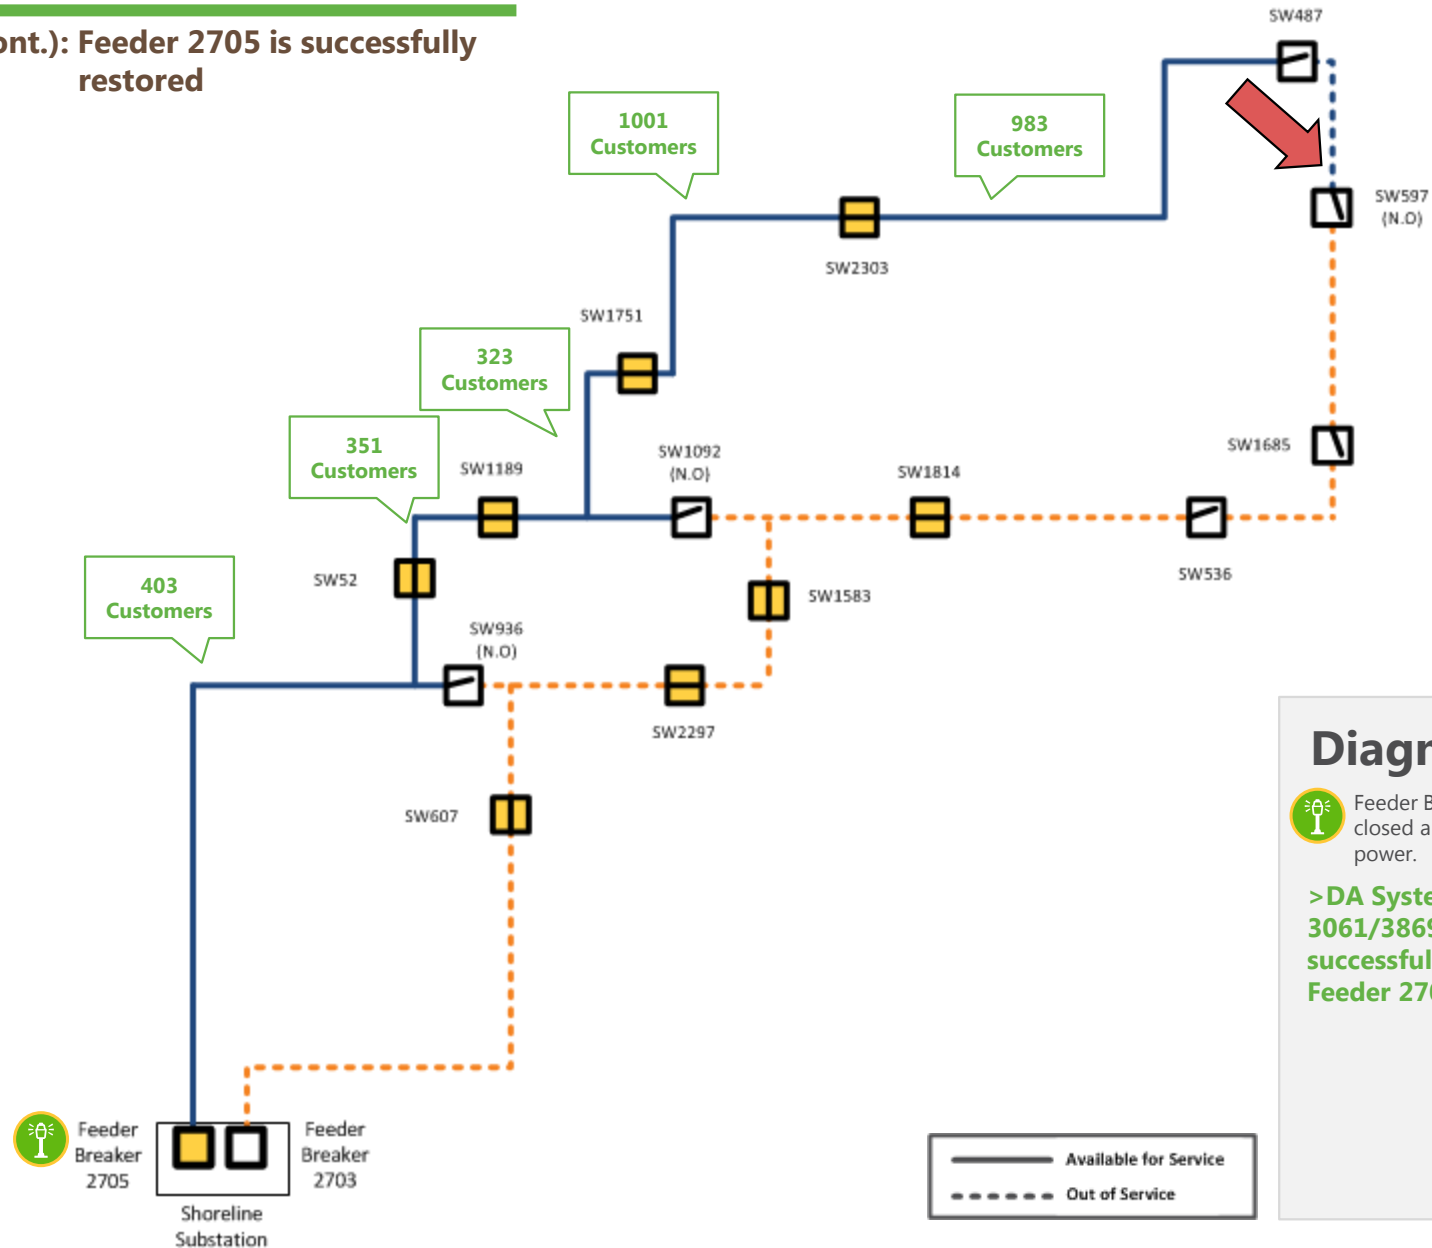

8/30/15, 12:34pm

 **Remote Action:**
Dispatcher has sent remote command to close SW487.

 Fault between SW487 and SW597.

08/2015 WINDSTORM

Event 4 (cont.): Feeder 2705 is successfully restored

Diagnostics

Feeder Breaker 2705 closed and restored power.

> DA System Alert:
3061/3869 customers successfully restored on Feeder 2705.

WINDSTORM 8/29/15 – DISTRIBUTION AUTOMATION (DA) SYSTEM PERFORMANCE

Assuming the event 3 which involved 115 kV outage had not occurred

WINDSTORM 8/29/15

Assuming the event 3 which involved 115 kV outage had not occurred

LESSONS LEARNED

- A lab, even small one, is critical for testing, troubleshooting and training.
- Fiber optics loop was intact throughout the serve storm
- The fast, secure remote access greatly reduce crew times for event data retrieval and configuration update
- Secure WIFI is a nice feature, reduce operation cost, and enhanced crew safety
- The system performed as intended. The Distribution Automation scheme identified, isolated, and rerouted after the faults appeared.
- Dispatchers were able to identify and send line crews to fix affected line segments faster than conventional methods.

QUESTIONS?

THANK YOU
